Grading	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
------------	------------------------------------------	------------------------------------------	----------------------------------------------	----------------------------------------------	-----------------------------

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Cubic Yards)	Material Exported (Cubic Yards)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Grading	0.00	—	1.50	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Non-applicable. No control strategies activated by user.

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
User Defined Recreational	0.00	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2042	0.00	204	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres
--------------------------	----------------------	---------------	-------------

5.18.1.2. Mitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres
--------------------------	----------------------	---------------	-------------

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres
--------------------	---------------	-------------

5.18.1.2. Mitigated

Biomass Cover Type	Initial Acres	Final Acres
--------------------	---------------	-------------

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)
-----------	--------	------------------------------	------------------------------

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)
-----------	--------	------------------------------	------------------------------

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14

Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Per client's data
Construction: Construction Phases	Per client's data.
Construction: Dust From Material Movement	Per client's data
Construction: Off-Road Equipment	Per client's data.
Construction: On-Road Fugitive Dust	Paved road dust percentage updated per discussions with team

Data Field	Value
Project Name	MV vineyard Year 3
Construction Start Date	1/1/2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	10.4
Location	38.64783565110025, -120.99284145657958
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	407
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
User Defined Recreational	13.8	User Defined Unit	13.8	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-5	Use Advanced Engine Tiers
Construction	C-10-A	Water Exposed Surfaces
Construction	C-13	Use Low-VOC Paints for Construction

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)
-----------	--------	------------------------------	------------------------------

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14

Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	56.10162967

Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Per client's data
Construction: Construction Phases	Per client's data.
Construction: Dust From Material Movement	Per client's data.
Construction: Off-Road Equipment	Per client's data.
Construction: On-Road Fugitive Dust	Paved road dust percentage updated per discussions with team

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	MV vineyard Year 8
Construction Start Date	1/1/2032
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	10.4
Location	38.64783565110025, -120.99284145657958
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	407
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
User Defined Recreational	13.8	User Defined Unit	13.8	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-5	Use Advanced Engine Tiers
Construction	C-10-A	Water Exposed Surfaces
Construction	C-13	Use Low-VOC Paints for Construction

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—

Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No

Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Per client's data
Construction: Construction Phases	Per client's data.
Construction: Dust From Material Movement	Per client's data.
Construction: Off-Road Equipment	Per client's data.
Construction: On-Road Fugitive Dust	Paved road dust percentage updated per discussions with team

--------------------	---------------	-------------

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)
-----------	--------	------------------------------	------------------------------

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)
-----------	--------	------------------------------	------------------------------

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14

Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	56.10162967

Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Per client's data
Construction: Construction Phases	Per client's data.
Construction: Dust From Material Movement	Per client's data.
Construction: Off-Road Equipment	Per client's data.
Construction: On-Road Fugitive Dust	Paved road dust percentage updated per discussions with team

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)
-----------	--------	------------------------------	------------------------------

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14

Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Per client's data
Construction: Construction Phases	Per client's data.
Construction: Dust From Material Movement	Per client's data.
Construction: Off-Road Equipment	Per client's data.
Construction: On-Road Fugitive Dust	Paved road dust percentage updated per discussions with team

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	MV OP 01
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	10.4
Location	38.6478356511002, -120.99284145657958
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	407
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Condo/Townhouse	102	Dwelling Unit	12.0	108,120	0.00	—	259	—

Apartments Low Rise	63.0	Dwelling Unit	3.00	66,780	0.00	—	160	—
Single Family Housing	220	Dwelling Unit	77.0	429,000	2,576,829	—	559	—
Junior High School	0.00	Student	0.00	0.00	0.00	0.00	—	—
Elementary School	0.00	Student	0.00	0.00	0.00	0.00	—	—
Strip Mall	0.00	1000sqft	0.00	0.00	0.00	—	—	—
General Office Building	0.00	1000sqft	0.00	0.00	0.00	—	—	—
City Park	7.00	Acre	7.00	0.00	7.00	7.00	—	—

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
-----------	---------------------------------

Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
-----------	---------------------------------

Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952
High school enrollment	13.5249583

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A

Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7

Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952
High school enrollment	13.5249583

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

- a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
- b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Energy Use	—
Operations: Water and Waste Water	Accounts for Policy 9.36 (20% reduction to indoor residential water use), Policy 9.37 (30% reduction to indoor non-residential water consumption) 13% increase in outdoor due to non-revenue demand. All per WSA.
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A

Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7

Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952
High school enrollment	13.5249583
Preschool enrollment	57.97510586
Transportation	—
Auto Access	59.70742974
Active commuting	15.10329783
Social	—
2-parent households	92.95521622
Voting	90.3118183
Neighborhood	—
Alcohol availability	89.56756063
Park access	9.867830104
Retail density	13.49929424
Supermarket access	20.99319902
Tree canopy	97.08712948

Housing	—
Homeownership	90.09367381
Housing habitability	74.47709483
Low-inc homeowner severe housing cost burden	44.87360452
Low-inc renter severe housing cost burden	48.96702169
Uncrowded housing	70.98678301
Health Outcomes	—
Insured adults	59.70742974
Arthritis	0.0
Asthma ER Admissions	68.9
High Blood Pressure	0.0
Cancer (excluding skin)	0.0
Asthma	0.0
Coronary Heart Disease	0.0
Chronic Obstructive Pulmonary Disease	0.0
Diagnosed Diabetes	0.0
Life Expectancy at Birth	58.0
Cognitively Disabled	10.2
Physically Disabled	36.0
Heart Attack ER Admissions	47.6

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
 b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team
Operations: Water and Waste Water	Accounts for Policy 9.36 (20% reduction to indoor residential water use), Policy 9.37 (30% reduction to indoor non-residential water consumption) 13% increase in outdoor due to non-revenue demand. All per WSA.

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team
Operations: Water and Waste Water	Accounts for Policy 9.36 (20% reduction to indoor residential water use), Policy 9.37 (30% reduction to indoor non-residential water consumption) 13% increase in outdoor due to non-revenue demand. All per WSA.

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	MV OP 04 _ Unmitigated
Operational Year	2030
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	10.4
Location	38.6478356511002, -120.99284145657958
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	407
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Condo/Townhouse	255	Dwelling Unit	30.0	270,300	0.00	—	648	—

Apartments Low Rise	126	Dwelling Unit	6.00	133,560	0.00	—	320	—
Single Family Housing	550	Dwelling Unit	192	1,072,500	6,442,071	—	1,397	—

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A

Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	—
Operations: Road Dust	Paved road dust percentage updated per discussions with team
Operations: Water and Waste Water	—

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	MV OP 04
Operational Year	2030
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	10.4
Location	38.6478356511002, -120.99284145657958
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	407
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Condo/Townhouse	255	Dwelling Unit	30.0	270,300	0.00	—	648	—

Apartments Low Rise	126	Dwelling Unit	6.00	133,560	0.00	—	320	—
Single Family Housing	550	Dwelling Unit	192	1,072,500	6,442,071	—	1,397	—

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A

Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7

Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952
High school enrollment	13.5249583
Preschool enrollment	57.97510586
Transportation	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team
Operations: Water and Waste Water	—

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
-----------	---------------------------------

Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
-----------	---------------------------------

Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
-----------	---------------------------------

Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
-----------	---------------------------------

Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
-----------	---------------------------------

Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	MV OP 12
Operational Year	2038
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	10.4
Location	38.6478356511002, -120.99284145657958
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	407
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Condo/Townhouse	647	Dwelling Unit	75.0	685,820	0.00	—	1,643	—

Apartments Low Rise	551	Dwelling Unit	28.0	584,060	0.00	—	1,400	—
Single Family Housing	1,430	Dwelling Unit	499	2,788,500	16,749,386	—	3,632	—
Junior High School	779	Student	19.0	91,581	0.00	0.00	—	—
Elementary School	0.00	Student	0.00	0.00	0.00	0.00	—	—
Strip Mall	66.7	1000sqft	1.53	66,668	0.00	—	—	—

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
-----------	---------------------------------

Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	TOG	ROG	NOx	CO	SO2	PM10E	PM10D	PM10T	PM2.5E	PM2.5D	PM2.5T	BCO2	NBCO2	CO2T	CH4	N2O	R	CO2e

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

1.1. Basic Project Information

Data Field	Value
Project Name	MV OP 15
Operational Year	2041
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	10.4
Location	38.6478356511002, -120.99284145657958
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	407
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Condo/Townhouse	647	Dwelling Unit	75.0	685,820	0.00	—	1,643	—

Apartments Low Rise	551	Dwelling Unit	28.0	584,060	0.00	—	1,400	—
Single Family Housing	1,755	Dwelling Unit	612	3,422,250	20,556,064	—	4,458	—
Junior High School	779	Student	19.0	91,581	0.00	0.00	—	—
Elementary School	0.00	Student	0.00	0.00	0.00	0.00	—	—
Strip Mall	66.7	1000sqft	1.53	66,668	0.00	—	—	—
General Office Building	333	1000sqft	7.65	333,336	0.00	—	—	—
City Park	45.0	Acre	45.0	0.00	45.0	45.0	—	—
Other Asphalt Surfaces	11.0	Acre	11.0	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Energy	E-2	Require Energy Efficient Appliances

2. Emissions Summary

2.4. Operations Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
-----------	---------------------------------

Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
-----------	---------------------------------

Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A

Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7

Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952
High school enrollment	13.5249583
Preschool enrollment	57.97510586
Transportation	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

- a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
- b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Energy Use	—
Operations: Water and Waste Water	Accounts for Policy 9.36 (20% reduction to indoor residential water use), Policy 9.37 (30% reduction to indoor non-residential water consumption) 13% increase in outdoor due to non-revenue demand. All per WSA.
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A

Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7

Linguistic	8.49
Poverty	39.2
Unemployment	70.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Energy Use	—
Operations: Water and Waste Water	Accounts for Policy 9.36 (20% reduction to indoor residential water use), Policy 9.37 (30% reduction to indoor non-residential water consumption) 13% increase in outdoor due to non-revenue demand. All per WSA.
Operations: Road Dust	Paved road dust percentage updated per discussions with team

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9

AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	Policy 9.51 forbids Woodstoves and Fireplaces; number of wood stoves and fireplaces replaced with gas stoves
Operations: Energy Use	—
Operations: Water and Waste Water	Accounts for Policy 9.36 (20% reduction to indoor residential water use), Policy 9.37 (30% reduction to indoor non-residential water consumption) 13% increase in outdoor due to non-revenue demand. All per WSA.
Operations: Road Dust	Paved road dust percentage updated per discussions with team

MV OP 18 _ unmitigated Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	MV OP 18 _ unmitigated
Operational Year	2045
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	10.4
Location	38.6478356511002, -120.99284145657958
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	407
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Condo/Townhouse	722	Dwelling Unit	84.0	765,320	0.00	—	1,834	—

Apartments Low Rise	551	Dwelling Unit	28.0	584,060	0.00	—	1,400	—

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A

Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
 b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	PGE Power Label for 2021, extrapolated based on RPS targets
Land Use	Per client's data.
Operations: Hearths	—

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A

Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Units all 800 square feet
Construction: Construction Phases	Per Client's data.
Construction: Dust From Material Movement	Per client's data.
Construction: On-Road Fugitive Dust	Paved road dust percentage updated per discussions with team
Construction: Architectural Coatings	Per client's data
Construction: Paving	Per client's data
Operations: Road Dust	Paved road dust percentage updated per discussions with team
Characteristics: Utility Information	Utility EFs updated per RPS
Operations: Water and Waste Water	17.6 acre-feet of water

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	VMVSP Secondary Units _ Policies 2045
Operational Year	2045
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	10.4
Location	38.64783565110025, -120.99284145657958
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	407
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Single Family Housing	98.0	Dwelling Unit	31.8	78,400	0.00	—	280	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-10-A	Water Exposed Surfaces
Construction	C-13	Use Low-VOC Paints for Construction
Energy	E-2	Require Energy Efficient Appliances

2. Emissions Summary

2.4. Operations Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	29.0	annual days of extreme heat
Extreme Precipitation	11.2	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	50.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A

Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	0	0	0	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	1	1	1	2
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	76.9
AQ-PM	14.3
AQ-DPM	7.14
Drinking Water	50.2
Lead Risk Housing	7.50
Pesticides	19.8
Toxic Releases	14.8
Traffic	64.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	43.8
Haz Waste Facilities/Generators	56.4
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	34.9
Cardio-vascular	29.4
Low Birth Weights	60.6
Socioeconomic Factor Indicators	—
Education	23.7
Housing	29.7
Linguistic	8.49
Poverty	39.2

Unemployment	70.9
--------------	------

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	56.10162967
Employed	51.71307584
Median HI	78.26254331
Education	—
Bachelor's or higher	64.07031952
High school enrollment	13.5249583
Preschool enrollment	57.97510586
Transportation	—
Auto Access	59.70742974
Active commuting	15.10329783
Social	—
2-parent households	92.95521622
Voting	90.3118183
Neighborhood	—
Alcohol availability	89.56756063
Park access	9.867830104
Retail density	13.49929424
Supermarket access	20.99319902
Tree canopy	97.08712948
Housing	—
Homeownership	90.09367381

Housing habitability	74.47709483
Low-inc homeowner severe housing cost burden	44.87360452
Low-inc renter severe housing cost burden	48.96702169
Uncrowded housing	70.98678301
Health Outcomes	—
Insured adults	59.70742974
Arthritis	0.0
Asthma ER Admissions	68.9
High Blood Pressure	0.0
Cancer (excluding skin)	0.0
Asthma	0.0
Coronary Heart Disease	0.0
Chronic Obstructive Pulmonary Disease	0.0
Diagnosed Diabetes	0.0
Life Expectancy at Birth	58.0
Cognitively Disabled	10.2
Physically Disabled	36.0
Heart Attack ER Admissions	47.6
Mental Health Not Good	0.0
Chronic Kidney Disease	0.0
Obesity	0.0
Pedestrian Injuries	43.9
Physical Health Not Good	0.0
Stroke	0.0
Health Risk Behaviors	—
Binge Drinking	0.0
Current Smoker	0.0

Other Indices	—
Hardship	46.4
Other Decision Support	—
2016 Voting	91.9

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	69.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Units all 800 square feet
Construction: Construction Phases	Per Client's data.
Construction: Dust From Material Movement	Per client's data.
Construction: On-Road Fugitive Dust	Paved road dust percentage updated per discussions with team
Construction: Architectural Coatings	Per client's data
Construction: Paving	Per client's data
Operations: Road Dust	Paved road dust percentage updated per discussions with team
Characteristics: Utility Information	Utility EFs updated per RPS
Operations: Water and Waste Water	20% reduction on 17.6 acre-feet of water
Operations: Hearths	Woodstoves - Policy 9.51 Zero out all amounts of Woodstoves; add number of wood fire places for each residential land use to the number of gas stoves

Appendix D

EDCAQMD Rule 223-1 Best Management Practices

Table 1. Construction and Other Earthmoving Activities

Source Category	Control Measure	EDCAQMD Guidance
Backfilling	A1. Stabilize backfill material when not actively handling; <u>and</u> A2. Stabilize backfill material during handling; <u>and</u> A3. Stabilize soil at completion of activity.	<ul style="list-style-type: none"> - Mix backfill soil with water prior to moving - Dedicate water truck or high capacity hose to backfilling equipment. - Empty loader bucket slowly so that no dust plumes are generated. - Minimize drop height from loader bucket.
Clearing and grubbing	B1. Maintain stability of soil through pre-watering of site prior to clearing and grubbing; <u>and</u> B2. Stabilize soil during clearing and grubbing activities; <u>and</u> B3. Stabilize soil immediately after clearing and grubbing activities.	<ul style="list-style-type: none"> - Maintain live perennial vegetation where possible. - Apply water in sufficient quantity to prevent generation of dust plumes.
Clearing forms	C1. Use water spray to clear forms; <u>or</u> C2. Use sweeping and water spray to clear forms; <u>or</u> C3. Use vacuum system to clear forms.	<ul style="list-style-type: none"> - Use of high pressure air to clear forms may cause exceedance of Rule requirements.
Crushing	D1. Stabilize surface soils prior to operation of support equipment; <u>and</u> D2. Stabilize material after crushing.	<ul style="list-style-type: none"> - Follow permit conditions for crushing equipment. - Pre-water material prior to loading into crusher. - Monitor crusher emissions opacity. - Apply water to crushed material to prevent dust plumes.
Cut and fill	E1. Pre-water soils prior to cut and fill activities; <u>and</u> E2. Stabilize soil during and after cut and fill activities	<ul style="list-style-type: none"> - For large sites, pre-water with sprinklers or water trucks and allow time for penetration. - Use water as necessary to keep dust down.
Demolition – mechanical/manual	F1. Stabilize wind erodible surfaces to reduce dust; <u>and</u> F2. Stabilize surface soil where support equipment and vehicles will operate; <u>and</u> F3. Stabilize loose soil and demolition debris.	<ul style="list-style-type: none"> - Apply water in sufficient quantities to prevent the generation of visible dust plumes.

Source Category	Control Measure	EDCAQMD Guidance
Disturbed soil	G1. Stabilize disturbed soil throughout the construction site; <u>and</u> G2. Stabilize disturbed soil between structures	<ul style="list-style-type: none"> - Limit vehicular traffic and disturbances on soils where possible. - If interior block walls are planned, install as early as possible. - Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes.
Earth-moving activities	H1. Pre-apply water; <u>and</u> H2. Re-apply water as necessary to maintain soils in a damp condition and to ensure that visible emissions do not exceed 50 feet or beyond property line in any direction; <u>and</u> H3. Stabilize soils once earth-moving activities are complete.	<ul style="list-style-type: none"> - Grade each project phase separately, timed to coincide with construction phase. - Upwind fencing can prevent material movement on site. - Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes.
Importing/exporting of bulk materials	I1. Stabilize or adequately wet material while loading to reduce fugitive dust emissions; <u>and</u> I2. Maintain at least six inches of freeboard on haul vehicles traveling offsite; <u>and</u> I3. Stabilize or adequately wet material while transporting to reduce fugitive dust emissions; <u>and</u> I4. Stabilize material while unloading to reduce fugitive dust emissions.	<ul style="list-style-type: none"> - Use tarps or other suitable enclosures on haul trucks. - Comply with track-out prevention/mitigation requirements. - Provide water while loading and unloading to reduce visible dust plumes.
Landscaping	J1. Stabilize soils, materials and slopes.	<ul style="list-style-type: none"> - Apply water to materials to stabilize. - Maintain materials in a crusted condition. - Maintain effective cover over materials - Stabilize sloping surfaces using soil binders until vegetation or ground cover can effectively stabilize the slopes - Hydroseed prior to rainy season.
Road shoulder maintenance	K1. Apply water to unpaved shoulders prior to clearing; <u>and</u> K2. Apply chemical dust suppressants and/or other appropriate material in accordance with DOT specifications to maintain a stabilized surface after completing road shoulder maintenance.	<ul style="list-style-type: none"> - Installation of curbing and/or paving of road shoulders can reduce recurring maintenance costs. - Use of chemical dust suppressants can inhibit vegetation growth and reduce future road shoulder maintenance costs.

Source Category	Control Measure	EDCAQMD Guidance
Screening	<p>L1. Pre-water material prior to screening; <u>and</u></p> <p>L2. Limit fugitive dust emissions to opacity and plume length standards; <u>and</u></p> <p>L3. Stabilize material immediately after screening.</p>	<ul style="list-style-type: none"> - Dedicate water truck or high capacity hose to screening operation. - Drop material through the screen slowly and minimize drop height. - Install wind barrier with a porosity of no more than 50% upwind of screen to the height of the drop point.
Staging areas	<p>M1. Stabilize staging areas during use; <u>and</u></p> <p>M2. Stabilize staging area soils at project completion.</p>	<ul style="list-style-type: none"> - Limit size of staging area. - Limit vehicle speeds to prevent visible dust in excess of standards per 223-1.4.A. - Limit number and size of staging area entrances/exists.
Stockpiles/Bulk Material Handling	<p>N1. Stabilize stockpiled materials.</p> <p>N2. Stockpiles within 100 yards of off-site occupied buildings must not be greater than eight feet in height; or must have a road bladed to the top to allow water truck access or must have an operational water irrigation system that is capable of complete stockpile coverage.</p>	<ul style="list-style-type: none"> - Add or remove material from the downwind portion of the storage pile. - Maintain storage piles to avoid slides.
Traffic areas for construction activities	<p>O1. Stabilize or maintain adequate moisture on all off-road traffic and parking areas; <u>and</u></p> <p>O2. Stabilize or maintain adequate moisture on all haul routes; <u>and</u></p> <p>O3. Direct construction traffic over established haul routes.</p>	<ul style="list-style-type: none"> - Apply gravel/paving to all haul routes as soon as possible to all future roadway areas. - Barriers can be used to ensure vehicles are only used on established parking areas/haul routes.
Trenching	<p>P1. Stabilize surface soils where trencher or excavator and support equipment will operate; <u>and</u></p> <p>P2. Stabilize soils at the completion of trenching activities.</p>	<ul style="list-style-type: none"> - Pre-watering of soils prior to trenching is an effective preventive measure. - Washing mud and soils from equipment at the conclusion of trenching activities can prevent crusting and drying of soil on equipment.
Truck loading	<p>Q1. Pre-water material prior to loading; <u>or</u></p> <p>Q2. Apply water as loader bucket is being emptied; <u>and</u></p> <p>Q2. Freeboard must be 6 inches or greater (VCS 23114)</p>	<ul style="list-style-type: none"> - Empty loader bucket such that no visible dust plumes are created. - Ensure that the loader bucket is close to the truck to minimize drop height while loading.
Turf Overseeding	<p>R1. Apply sufficient water immediately prior to conducting turf vacuuming activities to meet opacity and plume length standards; <u>and</u></p> <p>R2. Cover haul vehicles prior to exiting the site.</p>	<ul style="list-style-type: none"> - Haul waste material immediately off-site.

Source Category	Control Measure	EDCAQMD Guidance
Unpaved roads/ parking lots	S1. Stabilize soils to meet the applicable performance standards(Surface crusting); <u>and</u> S2. Limit vehicular travel to established unpaved roads (haul routes) and unpaved parking lots.	- Restricting vehicular access to established unpaved travel paths and parking lots can reduce stabilization requirements.
Vacant land	T1. In instances where vacant lots are 0.10 acre or larger and have a cumulative area of 500 square feet or more that are driven over and/or used by motor vehicles and/or off-road vehicles, prevent motor vehicle and/or off-road vehicle trespassing, parking and/or access.	- Installing barriers, curbs, fences, gates, posts, signs, shrubs, trees or other effective control measures to prevent access to motor or off-road vehicles.

Table 2. Bulk Material Handling

Source Category	Control Actions
Handling Of Bulk Materials	A1. When handling bulk materials, apply water or chemical/organic stabilizers/suppressants;
Storage of Bulk Materials	B1. When storing bulk materials, comply with the conditions for a stabilized surface; <u>or</u> B2. Cover bulk materials stored outdoors with tarps, plastic or other suitable material and anchor in such a manner that prevents the cover from being removed by wind action; <u>or</u> B3. Construct and maintain wind barriers with less than 50% porosity. If utilizing fences or wind barriers, apply water or chemical/organic stabilizers/suppressants; <u>or</u> B4. Utilize a 3-sided structure with a height at least equal to the height of the storage pile and with less than 50% porosity.
On-Site Transporting of Bulk Materials	C1. Limit vehicular speed while traveling on the work site; <u>or</u> C2. Load all haul trucks such that the freeboard is not less than six (6) inches when material is transported across any paved public access road; <u>or</u> C3. Apply water to the top of the load; <u>or</u> C4. Cover haul trucks with a tarp or other suitable cover.
Off-Site Transporting of Bulk Materials	D1. Clean the interior of the cargo compartment or cover the cargo compartment before the empty truck leaves the site; <u>and</u> D2. Prevent spillage or loss of bulk material from holes or other openings in the cargo compartment’s floor, sides and/or tailgate; <u>and</u> D3. Load all haul trucks such that the freeboard is not less than six (6) inches when material is transported on any paved road, and apply water to the top of the load; or cover haul trucks with a tarp or other suitable cover.
Outdoor Transport Of Bulk Materials With A Chute Or Conveyor:	E1. Fully enclose the chute or conveyor; <u>or</u> E2. Operate water spray equipment; <u>or</u> E3. Wash separated or screened materials to remove conveyed materials having an aerodynamic diameter of 10 microns or less.

Table 3. Removal and Prevention of Trackout

Source Category	Control Actions
Removal of Trackout Material	A1. Manually sweeping and picking-up; <u>or</u> A2. Operating a rotary brush or broom accompanied or preceded by sufficient wetting; <u>or</u> A3. Operating a PM10-efficient street sweeper; <u>or</u> A4. Flushing with water, where the use of water will not result in adverse impacts on storm water drainage systems or violate any National Pollutant Discharge Elimination System permit program; <u>and</u> A5. <u>The use of blower devices, or dry rotary brushes or dry brooms is expressly prohibited.</u>
Frequency of Trackout Material Removal	B1. At the minimum trackout must be removed at the end of the day; <u>and</u> B2. Trackout must be immediately removed when it extends 50 feet or more from the nearest unpaved surface exit point of a site; <u>and</u> B3. On interior paved roads trackout must be removed at least once per workday.
Trackout Prevention for Large Operations or Sites with more than 150 vehicle trips/day.	C1. Installation of grizzlies, or similar devices designed to remove dirt/mud from tires; <u>or</u> C2. Installation of gravel pads; <u>or</u> C3. Paving of interior roads.

Table 4. Blasting Activities

Source Category	Control Measure	EDCAQMD Guidance
Site Preparation (drilling, setting charges, burial of charges)	A1. Reduce dust from drilling operation A2. Pre-wet blast area A3. Cover charges to minimize dust	- Control rate of drilling - Apply water fog - Place blast mats over charges - Place soil mounds over charges - Wet entire area prior to blasting
Blasting activities	B1. Dust cannot exceed 50 ft or cross the project property line	- Conduct blasting on calm days - Consider wind direction with respect to your property line, nearby residences and other receptors.
Post-Blasting Activities	C1. Follow Best Management Practice for all construction activities (Rule 223-1, Table 1)	

Table 5. Large Operations Dust Control

Source Category	Control Actions
Earth-moving: (except construction cutting and filling areas, and mining operations)	<p>A1. Maintain soil moisture content at a minimum of 12 percent, as determined by ASTM method D-2216, or other equivalent method approved by the Air Pollution Control Officer. Two soil moisture evaluations must be conducted during the first three hours of active operations during a calendar day, and two such evaluations each subsequent four-hour period of active operations; <u>or</u></p> <p>A2. For any earth-moving which is more than 50 feet from all property lines, conduct watering as necessary to prevent visible dust emissions from exceeding 50 feet in length in any direction. Visible emissions must not extend beyond property boundary.</p>
Earth-moving: Construction fill areas	<p>B1. Maintain soil moisture content at a minimum of 12 percent, as determined by ASTM method D-2216, or other equivalent method approved by the Air Pollution Control Officer. For areas which have an optimum moisture content for compaction of less than 12 percent, as determined by ASTM Method 1557 or other equivalent method approved by the Air Pollution Control Officer complete the compaction process as expeditiously as possible after achieving at least 70 percent of the optimum soil moisture content. Two soil moisture evaluations must be conducted during the first three hours of active operations during a calendar day, and two such evaluations during each subsequent four hour period of active operations; <u>or</u></p> <p>B2. For any earth-moving which is more than 50 feet from all property lines, conduct watering as necessary to prevent visible dust emissions from exceeding 50 feet in length in any direction. Visible emissions must not extend beyond property boundary.</p>
Earth-moving: Construction cut areas	<p>C1. Conduct watering as necessary to prevent any visible emissions from extending beyond property boundary.</p>
Disturbed surface areas: (except completed grading areas)	<p>D1. Apply dust suppression in sufficient quantity and frequency to maintain a stabilized surface. Any areas which cannot be stabilized, as evidenced by wind driven fugitive dust must have an application of water at least twice per day to at least 80 percent of the unstabilized area.</p>
Disturbed surface areas: Completed grading areas	<p>E1. Apply chemical stabilizers within five working days of grading completion; <u>or</u></p> <p>E2. Take actions F1 or F3 specified for inactive disturbed surface areas.</p>
Inactive disturbed surface areas	<p>F1. Apply water to at least 80 percent of all inactive disturbed surface areas on a daily basis when there is evidence of wind driven fugitive dust, excluding any areas which are inaccessible to watering vehicles due to excessive slope or other safety conditions; <u>or</u></p> <p>F2. Apply dust suppressants in sufficient quantity and frequency to maintain a stabilized surface; <u>or</u></p> <p>F3. Establish a vegetative ground cover within 21 days after active operations have ceased. Ground cover must be of sufficient density to expose less than 30 percent of unstabilized ground within 90 days of planting, and at all times thereafter; <u>or</u></p> <p>F4. Utilize any combination of control actions F1, F2 and F3 such that, in total, these actions apply to all inactive disturbed surface areas.</p> <p>F5. Establishment and maintenance of surface crusting sufficient to satisfy the test in Section 223-1.10</p> <p>F6. Approved mixture of tackifier and fiber mulch, applied per manufacturer's recommendation.</p>

Source Category	Control Actions
Unpaved Roads	G1. Water all roads used for any vehicular traffic at least once per every two hours of active operations or as often as necessary; <u>or</u> G2. Apply a chemical stabilizer to all unpaved road surfaces in sufficient quantity and frequency to maintain a stabilized surface; <u>and</u> G3. Restrict vehicle speeds where necessary ;
Open storage piles	H1. Apply chemical stabilizers; <u>or</u> H2. Apply water to at least 80 percent of the surface area of all open storage piles on a daily basis when there is evidence of wind driven fugitive dust; <u>or</u> H3. Install temporary coverings; <u>or</u> H4. Install a three-sided enclosure with walls with no more than 50 percent porosity which extend, at a minimum, to the top of the pile. This option may only be used at aggregate-related plants or at cement manufacturing facilities.
All Categories	I1. Any other control measures approved by the Air Pollution Control Officer as equivalent to the methods specified in Table 5 may be used.

Table 6. Large Operations Contingency Dust Control

Source Category	Control Actions
Earth-moving	A1. Cease all active operations except for dust mitigation activities; <u>or</u> A2. Apply water to soil not more than 15 minutes prior to moving such soil; <u>and</u> A3. Apply water during soil moving or disturbance operations.
Disturbed surface areas	B1. On the last day of active operations prior to a weekend, holiday or any other period when active operations will not occur for not more than four consecutive days: apply water with a mixture of chemical stabilizer diluted to not less than 1/20 of the concentration required to maintain a stabilized surface for a period of six months; <u>or</u> B2. Apply chemical stabilizers prior to wind event; <u>or</u> B3. Apply water to all unstabilized disturbed areas 3 times per day. If there is any evidence of wind driven fugitive dust, watering frequency is increased to a minimum of four times per day; <u>or</u> B4. Take the actions specified in Table 5, control action F3; <u>or</u> B5. Utilize any combination of control actions B1, B2 and B3B such that, in total, these actions apply to all disturbed surface areas.
Unpaved roads	C1. Apply chemical stabilizers prior to wind event; <u>or</u> C2. Apply water twice per hour during active operation; <u>or</u> C3. Stop all vehicular traffic, except for dust mitigation equipment.
Open storage piles	D1. Apply water twice per hour; <u>or</u> D2. Install temporary coverings.
Bulk Material Transport	E1. Cover all haul vehicles; <u>or</u> E2. Freeboard must be 6 inches or greater (VCS 23114)
All Categories	F1. Any other control measures approved by the Air Pollution Control Officer as equivalent to the methods specified in Table 6 may be used.

REFERENCE B - Asbestos Airborne Toxic Control Measure For Surfacing Applications, Section 93106, Title 17, California Code of Regulations	

5-2.1 GENERAL

- A. **PURPOSE:** The purpose of this Rule is to reduce the amount of asbestos particulate matter entrained in the ambient air as a result of any construction or construction related activities, that disturbs or potentially disturbs naturally occurring asbestos by requiring actions to prevent, reduce or mitigate asbestos emissions.
- B. **APPLICABILITY:** Unless one of the exemptions specified in Section 223-2.2 Exemptions applies, this Rule shall apply to **any construction or construction related activity** that:
1. is in excess of 20 cubic yards of graded material per project, or if required by the Air Pollution Control Officer **and**
 2. meets **either** of the following criteria:
 - . Any portion of the area to be disturbed:
 - . is located in a geographic ultramafic rock unit, **or**
 - . has naturally-occurring asbestos, serpentine or ultramafic rock as determined by owner/operator, Professional Geologist or the Air Pollution Control Officer, **or**
 - ii. is located within designated Naturally Occurring Asbestos Review Areas on the current El Dorado County Naturally Occurring Asbestos Review Area Map
 - . Naturally-occurring asbestos, serpentine, or ultramafic rock is discovered by the owner/operator, a Professional Geologist, or the Air Pollution Control Officer in the area to be disturbed after the start of any construction or construction related activity.

C. ASBESTOS RELATED STATE OF CALIFORNIA REGULATIONS

1. In addition to the requirements of this rule there are two State of California regulations for asbestos control that are applicable within El Dorado County and enforceable by the El Dorado County Air Quality Management District (EDCAQMD). These two asbestos control regulations are Attachments A and B to this rule.
 - . Reference A: Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying and Surface Mining Operations (California Code of Regulations, Title 17, Section 93105)
 - . Reference B: Asbestos Airborne Toxic Control Measure (ATCM) for Surfacing Applications (California Code of Regulations, Title 17, Section 93106)
1. A person who is subject to the Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying and Surface Mining Operations (California Code of Regulations, Title 17, Section 93105) is required to comply with the following sections in addition to the requirements under the ATCM:
 - a. Section 223-2.4.A. regarding the visible emission standards.
 - b. Section 223-2.4.C: regarding the suspension of operations under high wind conditions.
 - c. Section 223-2.4.D: regarding the posting of Asbestos Warning signs.
 - d. Section 223-2.6.A and B: regarding trackout removal.

- e. Section 223-2.6.D: regarding disposal of asbestiform containing soils removed by excavation.
- e. Section 223-2.6.E: regarding 30-day time limit and other requirements for completion of post construction stabilization/mitigation.

223-2.2 EXEMPTION

- A. **GENERAL:** Exemptions as defined in EDCAQMD Rule 223.2 A through F shall apply to this rule.
- B. **GEOLOGIC EVALUATION:** The Air Pollution Control Officer may provide an exemption from this Rule for any property that meets at least one of the criteria in Section 223-2.1.B if a Professional Geologist has **conducted** a geologic evaluation of the property and determined that no serpentine or ultramafic rock, or asbestos, is likely to be found in the area to be disturbed. Before an exemption can be granted, the owner/operator must provide a copy of a report detailing the geologic evaluation to the Air Pollution Control Officer for his or her consideration.
 - 1. At a minimum, the geologic evaluation must include:
 - a. A general description of the property and the proposed use;
 - b. A detailed site characterization which may include:
 - . A physical site inspection;
 - . Offsite geologic evaluation of adjacent property;
 - . Evaluation of existing geological maps and studies of the site and surrounding area;
 - . Development of geologic maps of the site and vicinity;
 - . Identification and description of geologic units, rock and soil types, and features that could be related to the presence of ultramafic rocks, serpentine, or asbestos mineralization; and
 - . A subsurface investigation to evaluate the nature and extent of geologic materials in the subsurface where excavation is planned; methods of subsurface investigation may include, but are not limited to borings, test pits, trenching, and geophysical surveys;
 - c. A classification of rock types found must conform to the nomenclature based on the International Union of Geological Science system;
 - d. A description of the sampling procedures used;
 - e. A description of the analytical procedures used, which may include mineralogical analyses, petrographic analyses, chemical analyses, or analyses for asbestos content;
 - f. An archive of collected rock samples for third party examination (to be kept for at least one year after the completion of the project); and
 - g. A geologic evaluation report documenting observations, methods, data, and findings; the format and content of the report should follow the Guidelines for the Assessment of Naturally Occurring Asbestos issued by the California Geologic Survey.
 - 2. The Air Pollution Control Officer may request any additional tests or other information needed to evaluate an application for exemption
 - 3. The Air Pollution Control Officer shall grant or deny a request for an exemption within 30 days of the receipt of a complete application.
 - 4. If the request for an exemption is denied, the Air Pollution Control Officer shall provide written reasons for the denial.

5. Expiration of the Geologic Exemption: If the owner/operator discovers any naturally-occurring asbestos, serpentine, or ultramafic rock in the area to be disturbed after the exemption is granted, then:
 - a. The owner/operator must comply with the requirements of this Rule.
 - b. The owner/operator must report the discovery of the naturally-occurring asbestos, serpentine or ultramafic rock to the Air Pollution Control Officer no later than the next business day.
 - g. The exemption under Section 223-2.2.B shall expire and cease to be effective.

223-2.3 DEFINITIONS

In addition to the definitions of terms in EDCAQMD Rule 223 (General Requirements), the following definitions shall apply to this rule.

- E. **ADEQUATELY WETTED:** sufficiently moistened with water to minimize the release of particulate matter into the ambient air.
- F. **APPROVED ASBESTOS BULK TEST METHOD:** ARB Test Method 435 or an alternative asbestos bulk test method approved in writing by the Executive Officer of the California Air Resources Board.
- G. **ARB:** the California Air Resources Board.
- H. **ARB TEST METHOD 435:** the test method specified in title 17, California Code of Regulations, Section 94147.
- I. **ASBESTOS:** asbestiforms of the following minerals: chrysotile (fibrous serpentine), crocidolite (fibrous riebeckite), amosite (fibrous cummingtonite--grunerite), asbestiform amphiboles (e.g. edenite, winchite and richterite), fibrous tremolite, fibrous actinolite, fibrous anthophyllite and tremolite/actinolite solution series of asbestiform minerals.
- J. **ASBESTOS-CONTAINING MATERIAL:** any material that has asbestos content of 0.25 percent or greater by ARB test method 435.
- K. **ASBESTOS CONTAINING WASTE or ACW:** asbestos containing waste managed at a landfill as authorized by Section 25143.7, chapter 6.5 of the California Health and Safety Code, which contains greater than (1%) friable asbestos by weight. Asbestos containing waste does not include waste contaminated with another hazardous waste as identified in chapter 11, division 4.5, Title 22, California Code of Regulations.
- L. **ASBESTOS DUST MITIGATION PLAN:** a detailed written document specifying measures that would be implemented to minimize the emissions of asbestos-laden dust.
- D. **EL DORADO COUNTY NATURALLY OCCURRING ASBESTOS REVIEW AREA MAP:** a map created by adding mapping accuracy buffers to (1) faults and areas likely to contain asbestos as shown on the March 2000 Department of Mines and Geology "Areas More Likely to Contain Naturally-Occurring Asbestos in Western El Dorado County, California" map and (2) documented discovery sites containing at least 0.25% Asbestos. The most current map is provided on the EDCAQMD website and is available at the El Dorado County Surveyor's office.

- E. **GEOGRAPHIC ULTRAMAFIC ROCK UNIT:** a geographic area that is designated as an ultramafic rock unit or ultrabasic rock unit, including the unit boundary line, on any of the maps referenced in Appendix A of the Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying and Surface Mining, Section 93105, Title 17, California Code of Regulations
- F. **GEOLOGIC EVALUATION:** an evaluation of a property by a Professional Geologist to determine the presence of various types of rocks, including but not limited to ultramafic rock, serpentinite, or other metamorphic derivatives of ultramafic rock.
- G. **HEPA FILTER:** a High Efficiency Particulate Air filter used to remove particles less than one (1) micron in aerodynamic diameter that operates at removal efficiencies of 99.9 percent or greater.
- H. **NATURALLY-OCCURRING ASBESTOS:** asbestos that has not been processed in an asbestos mill or is not asbestos mine tailings.
- I. **PROFESSIONAL GEOLOGIST:** an individual who is currently licensed as a geologist with the State of California, Department of Consumer Affairs, Board of Geology and Geophysicists.
- J. **REMOTE LOCATION:** any location that is at least one (1.0) mile from the location of a receptor.
- K. **RECEPTOR:** includes, but is not limited to, any hospital, school, day care center, work site, business, residence, and permanent campground. The distance to the nearest receptor is to be measured from the outermost limit of the area to be disturbed or road surface, whichever is closer.
- L. **SERPENTINE:** any form of the following hydrous magnesium silicate minerals: antigorite, lizardite, and chrysotile.
- M. **SERPENTINITE:** a rock consisting almost entirely of serpentine, although small amounts of other minerals such as magnetite, chromite, talc, brucite, and tremolite-actinolite may also be present. "Serpentinite" is a metamorphic derivative of the ultramafic rocks, peridotite, pyroxenite, or dunite.
- N. **ULTRABASIC ROCK:** ultramafic rock.
- O. **ULTRAMAFIC ROCK:** an igneous rock composed of 90 percent or greater of one or a combination of the following iron/magnesium-rich, dark-colored silicate minerals: olivine, pyroxene or more rarely amphibole. For the purposes of this section, "ultramafic rock" includes the following rock types: dunite, pyroxenite and peridotite; and their metamorphic derivatives.
- P. **VEGETATIVE COVER:** ground cover with sufficient density to expose less than 30 percent of unstabilized ground within 90 days of planting, and at all times thereafter.

1-9.1 GENERAL REQUIREMENTS

- A. Visible emissions shall not exceed the shade designated as No. 0 on the Ringelmann Chart, or 0% opacity as determined in accordance with US EPA Method 9, at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed the shade designated as No. 1 on the Ringelmann Chart, or 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 through 4 of this Rule or

similar effective measures shall be utilized to comply with fugitive dust standards of this rule from each fugitive dust source type within the active operation.

- A. Vehicle Speed Limitations and Posting of Speed Limit Signs
 - 1. An owner/operator shall limit the speed of vehicles traveling within construction sites to a maximum of 15 miles per hour.
 - 2. An owner/operator shall post speed limit signs limiting vehicle speed to maximum of 15 miles per hour that meet State and Federal Department of Transportation standards at each construction site's uncontrolled unpaved access/haul road entrance.
- C. When sustained wind speeds result in visible dust emissions in excess of the standards in Section 223-2.4 A., despite the application of dust mitigation measures, grading and earthmoving operations except except for dust mitigation activities shall be suspended
- D. Warning Signs shall be posted at the main entrance(s) to the project for the duration of soil disturbance activities. Signs shall be posted in letter of sufficient size as to be readily visible and legible. The following wording is recommended: "Warning. Soils in the area may contain naturally occurring asbestos. Asbestos is a known carcinogen. Report excessive fugitive dust to the contractor at (contractor phone number), NOA Hotline: 888-FYI4NOA or EDCAQMD: 530-621-6662"
- I. Following operations and activities are expressly prohibited:
 - 2. Rock crushing of asbestos-containing material;
 - 2. Use of blower devices for any removal of asbestos-containing material.

223-2.5 ADMINISTRATIVE REQUIREMENTS

- A. Asbestos Dust Mitigation Plan
 - 1. An owner/operator shall submit an Asbestos Dust Mitigation Plan to the Air Pollution Control Officer prior to the start of any construction activity that is applicable to this rule. An updated Asbestos Dust Mitigation Plan must be submitted if the project is significantly modified, a new grading permit is issued, the owner/operator changes or at the request of the Air Pollution Control Officer.

Construction activities shall not commence until the Air Pollution Control Officer has approved or conditionally approved the Asbestos Dust Mitigation Plan. An owner/operator shall provide written notification to the Air Pollution Control Officer at least 10 days prior to the commencement of earthmoving activities via fax or mail. Projects that are less than 1 acre shall provide notification to the Air Pollution Control Officer at least 48 hours prior to earthmoving activities via fax or mail. The requirement to submit an Asbestos Dust Mitigation Plan shall apply to all such activities conducted for residential and non-residential (e.g., commercial, industrial, or institutional) purposes or conducted by any governmental entity.
 - 2. . An owner/operator may submit one Asbestos Dust Mitigation Plan covering multiple construction stages within same project, provided the plan includes description of activities and

control measures for all stages of the project. The Asbestos Dust Mitigation Plan shall specify the expected start and final completion date of each project.

3. Asbestos Dust Mitigation Plan shall describe all dust mitigation measures to be implemented before, during and after any dust generating activity.
4. Asbestos Dust Mitigation Plan shall contain all the information described in Section 223-2.5.B. The Air Pollution Control Officer shall approve, disapprove or conditionally approve the Asbestos Dust Mitigation Plan within 30 days of plan submittal.
5. An owner/operator shall retain a copy of an approved Asbestos Dust Mitigation Plan at the project site. The approved Asbestos Dust Mitigation Plan shall remain valid until the termination of all dust generating activities. Failure to comply with the provisions of an approved Asbestos Dust Mitigation Plan is deemed to be a violation of this rule. Regardless of whether an approved Asbestos Dust Mitigation Plan is in place or not, or even when the owner/operator responsible for the plan is complying with an approved Asbestos Dust Mitigation Plan, the owner/operator shall comply also with all requirements of this Rule at all times.

B. An Asbestos Dust Mitigation Plan shall contain all of the following information:

0. Name(s), address(s), and phone number(s) of person(s) and owner(s)/operator(s) responsible for the preparation, submittal, and implementation of the Asbestos Dust Mitigation Plan and responsible for the dust generating operation and the application of dust control measures.
0. A plot plan which shows the type and location of each project.
0. The total area of land surface to be disturbed and total area in acres of the entire project site.
0. The expected start and completion dates of dust generating and soil disturbance activities to be performed on the site.
0. The actual and potential sources of fugitive dust emissions on the site and the location of bulk material handling and storage areas, paved and unpaved roads; entrances and exits where carryout/trackout may occur; and traffic areas.
0. Best Management Practice (Rule 223-2, Table 1 through 4) or other effective measures for:
 - . Construction
 - . Bulk Material Handling
 - . Carryout and Trackout Management
 - . Blasting Activities
0. Large Operations must include Dust Control Measures (Rule 223-2, Table 5 and 6).
0. If chemical dust suppressants are to be applied, the following information must be included: product specifications; manufacturer's usage instructions (method, frequency, and intensity of application); type, number, and capacity of application equipment; and information on environmental impacts and approvals or certifications related to appropriate and safe use for ground application.
0. Specific surface treatment(s) and/or control measures utilized to control material carryout, trackout, and sedimentation where unpaved and/or access points join paved roads.

10. Frequency of reporting: The plan shall state how often the items specified in Section 223-2.9. and any other items identified in the plan, will be reported to the EDCAQMD.

223-2.6 REQUIREMENTS FOR TRACKOUT MANAGEMENT, EXCAVATED SOIL MANAGEMENT AND POST-CONSTRUCTION STABILIZATION

- A. An owner/operator shall prevent or cleanup carryout and trackout as specified in Section 223-2.6.A. The use of blower devices, or dry rotary brushes or brooms, for removal of carryout and trackout on public roads is expressly prohibited. The removal of carryout and trackout from paved public roads does not exempt an owner/operator from obtaining state or local agency permits which may be required for the cleanup of mud and dirt on paved public roads.
1. Owners/operators shall prevent carryout and trackout, or remove all visible carryout and trackout immediately.
 2. Cleanup of carryout and trackout shall be accomplished by:
 - a. Wet sweeping and picking-up; or
 - b. Operating a HEPA filter equipped vacuum device; or
 - c. Flushing with water, if curbs or gutters are not present, and where the use of water will not result in a source of trackout material or result in adverse impacts on storm water drainage systems or violate any National Pollutant Discharge Elimination System permit program.
- E. An owner/operator of any site with 150 or more vehicle trips per day, or 20 or more vehicle trips per day by vehicles with three or more axles shall in addition to the requirements in Section 223-2.6.A, take the following preventative actions for carryout and trackout:
1. Installing and maintaining a trackout control device (grizzlies, gravel pads or paved surfaces) designed and maintained to control trackout at all access points to paved public roads; or
 2. Utilizing a carryout and trackout prevention procedure which has been demonstrated to the satisfaction of the Air Pollution Control Officer as achieving an equivalent or greater level of control.
- F. Control for disturbed surface areas and storage piles, shall comply with all applicable requirements of this Rule.
- G. Disposal of asbestiform containing soils removed by excavation:
1. Placing excavated soils into fills constructed elsewhere on the project.
 - a. The location(s) of such removals and the placement quantities and locations shall be documented.
 - b. Fills with a naturally occurring asbestos content equal to or greater than 1.0% by ARB Test Method 435, or when visually evident fibrous materials likely to be asbestos are present, located in residential landscaping areas shall be covered by at least two feet (24 inches) of non-asbestiform containing material or by concrete or asphalt paving.
 2. It is the owner/operator responsibility that final destination (usage or disposal) and transports of any excavated soils from the project is in conducted in full compliance with pertinent federal,

state and local rules and regulations including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

3. For any soils transported off-site the following information must be documented, retained for a period of at least 3 years, and provided to the Air Pollution Control Officer upon request:
 - e. Project location
 - f. Laboratory results for any asbestos soil testing done at the project location
 - g. Date(s) of off-site transport(s) of excavated soils
 - h. Location(s) where excavated soils were transported to
 - i. Total quantity transported to each location
 - j. Intended usage (fill, surface application), if the final destination is other than Class II or Class III landfill disposal facility.

- H. Control for off-site transport. The owner/operator shall ensure that no trucks are allowed to transport excavated material off-site unless:
 1. Trucks are maintained such that no spillage can occur from holes or other openings in cargo compartments; and
 2. Loads are adequately wetted; and
 - a. Covered with tarps; or
 - b. Loaded such that the material does not touch the front, back, or sides of the cargo compartment at any point less than six inches from the top and that no point of the load extends above the top of the cargo compartment.
 5. If excavated material is classified as a hazardous waste/material, off-site transport must comply with pertinent State and Federal rules and regulations.

- I. Post construction stabilization of disturbed areas. For multiple phase projects, the property owner shall be responsible for ensuring that the soil be stabilized following each phase of the project using one of the methods listed below or by any other method approved by the APCO. Upon completion of all phases of the project, but no later than 30 days following the end of soil disturbing activities, all disturbed surfaces with naturally occurring asbestos content of equal to or greater than 0.25% by ARB test method 435 shall be stabilized using one or more of the following methods:
 1. Establishment of a vegetative cover;
 2. Placement of non-asbestos containing material on disturbed soil areas shall be as follows:
 - a. At least three (3.0) inches in residential and nonresidential areas;
 - b. A total of at least twelve (12) inches or the maximum depth of irrigation improvements, whichever is higher, in residential landscaping areas with a naturally occurring asbestos content greater than 0.25% by ARB Test Method 435, or when visually evident fibrous materials likely to be asbestos are present;
 3. Paving, building foundations, concrete flatwork or retaining walls

223-2.7. ADDITIONAL REQUIREMENTS FOR LARGE OPERATIONS

- E. Any person who conducts or authorizes the conducting of a large operation subject to this Rule shall implement the applicable actions specified in Table 5 of this Rule at all times and shall implement the

applicable actions specified in Table 6 of this Rule when the applicable performance standards can not be met through use of Table 5 actions; and shall:

0. Submit a Large Operation Notification to the Air Pollution Control Officer within 7 days of qualifying as a large operation;
0. Maintain daily records to document the specific dust control actions taken, maintain such records for a period of not less than three years; and make such records available to the Air Pollution Control Officer upon request;
0. Identify a dust control supervisor that:
 - a. is employed by or contracted with the property owner or developer;
 - b. is on the site or available on-site within 30 minutes during working hours;
 - c. has the authority to expeditiously employ sufficient dust mitigation measures to ensure compliance with all Rule requirements.

223-2.8 AIR MONITORING FOR ASBESTOS

A. Pursuant to the requirements of California Health and Safety Code Section 41511:

1. Air monitoring may be required by the Air Pollution Control Officer.
2. The Air Pollution Control Officer may require revisions to the asbestos dust mitigation plan on the basis of the results of the air monitoring.

. Air monitoring for asbestos (if required by the Air Pollution Control Officer).

0. If required by the Air Pollution Control Officer, the Asbestos Dust Mitigation Plan shall include an air-monitoring component.
 1. The air monitoring component shall specify the following:
 - . Type of air sampling device(s);
 - . Siting of air sampling device(s);
 - . Sampling duration and frequency; and
 - . Analytical method
 - . Frequency and detail of analytical data submittal

223-2.9 RECORDKEEPING AND REPORTING REQUIREMENTS

A. Recordkeeping Requirements: The owner shall retain all of the following records for at least ten (10) years following the completion of the construction project:

0. The results of any air monitoring conducted any time during the project.
0. The documentation for any geologic evaluation conducted on the property for the purposes of obtaining an exemption, except the archive of collected samples which may be discarded at the expiration of the exemption or one (1) year after the exemption is granted whichever is less.
0. The results of any asbestos bulk sampling that meets any of the following conditions:

- a. The asbestos bulk sampling was conducted by the owner/operator to document the applicability of or compliance with this section.
 - b. The asbestos bulk sampling was done at the request of the Air Pollution Control Officer or the El Dorado Building Department or Department of Transportation (DOT).
7. The placement quantities and both removal and placement location of asbestiform containing soils removed by excavation as required in 223-2.6.D.
 8. Records and reports for the project, as defined in 223-2.9.A, shall be provided upon request with disclosures in real estate transactions concerning the project or property.
- B. Reporting Requirements: The owner/operator of any grading or construction operation subject to this section shall submit the following to the EDCAQMD:
1. The results of any air monitoring conducted at the request of the Air Pollution Control Officer.
 2. The laboratory results of any asbestos bulk sampling or testing.
 3. The areas where asbestos was identified, removed, and placed, onsite or offsite shall be described upon completion of the project.
 4. Any public complaints received by the contractor during the project shall be reported as requested by the Air Pollution Control Officer.

223-2.10 TEST METHODS

- E. Ultramafic Rock: The ultramafic rock composition of any material shall be determined using standard analysis techniques including, but not limited to, color index assessment, microscopic examination, petrographic analysis or rock thin sections, or chemical analysis techniques, such as X-ray fluorescence spectrometry or inductively coupled plasma analysis.
- F. Bulk Sampling Methods: ARB Test Method 435, or an alternative asbestos bulk test method approved in writing by the Executive Officer of the California Air Resources Board, shall be used to determine the asbestos content of a bulk sample. For the purposes of determining compliance with this section, references in ARB Test Method 435 to "serpentine aggregate" shall mean "gravel" or other "bulk materials" to be tested for asbestos content.
- G. Surface Crusting: "Measurement of the stability of surface crusting on horizontal surfaces" shall be as follows:
1. Where a visible crust exists, drop a steel ball with a diameter of 15.9 millimeters (0.625 inches) and a mass ranging from 16 to 17 grams from a distance of 30 centimeters (one foot) directly above at a 90 degree angle (perpendicular) to the ground surface. If blowsand (thin deposits of loose grains covering less than 50 percent of the surface that have not originated from the surface being tested) is present, clear the blowsand from the surfaces to be tested before dropping the steel ball.
 2. A sufficient crust is determined to exist if, when the ball is dropped according to Section 223-2.10.C.1 the ball does not sink into the surface so that it is partially or fully surrounded by loose

grains and, upon removing the ball, the surface on which it was dropped has not been pulverized so that loose grains are visible.

0. Drop the ball three times each in three representative test areas within a survey area measuring 1 foot by 1 foot that represents a random portion of the surface being evaluated. The test area shall be deemed to have passed if at least two of the three times the ball was dropped, the results met the criteria in Section 223-2.10.C.1. If all three test areas pass, the area shall be deemed to be “sufficiently crusted”.
- C. Analysis of Air Samples: Analysis of all air samples shall follow the analytical method specified by the United States Environmental Protection Agency, Asbestos Hazard Emergency Response Act (AHERA) criteria for asbestos (40 CFR, Part 763 Subpart E, Appendix A, adopted October 30, 1987), with the following exceptions:
0. The analytical sensitivity shall be 0.001 structures per cubic centimeter (0.001 s/cc); and
 0. All asbestos structures with an aspect ratio greater than three to one (3:1) shall be counted irrespective of length.
 2. The results of the analysis of air samples shall be reported as transmission electron microscopy (TEM) asbestos structures per cubic centimeter (s/cc).
- D. Adequately Wetted: Field determination of “adequately wetted” shall be as follows:
0. If the district-approved asbestos dust mitigation plan has specified a percent moisture content for specific materials the determination shall be as specified in the district-approved asbestos dust mitigation plan; or
 0. If no moisture threshold is specified in a district-approved asbestos dust mitigation plan, a sample of at least one (1) quart in volume shall be taken from the top three (3) inches of a road, or bare area or from the surface of a stockpile. The sample shall be poured out from a height of four (4) feet onto a clean hard surface. The material shall be considered to be adequately wetted if there is no observable dust emitted when the material is dropped.

RULE 223-2 TABLE 1
BEST MANAGEMENT PRACTICE FOR ASBESTOS DUST MITIGATION
(Construction And Other Earthmoving Activities)

Source Category	Control Measure	Guidance
Backfilling	A1 Stabilize backfill material when not actively handling; <u>and</u> A2 Stabilize backfill material during handling; <u>and</u> A3 Stabilize soil at completion of activity. .	Mix backfill soil with water prior to moving Dedicate water truck or high capacity hose to backfilling equipment. Empty loader bucket slowly so that no dust plumes are generated. Minimize drop height from loader bucket.
Clearing and grubbing	B1 Maintain stability of soil through pre-watering of site prior to clearing and grubbing; <u>and</u> B2 Stabilize soil during clearing and grubbing activities; <u>and</u> B3 Stabilize soil immediately after clearing and grubbing activities.	Maintain live perennial vegetation where possible. Apply water in sufficient quantity to prevent generation of visible dust.
Clearing forms	C1 Use water spray to clear forms; <u>or</u> C2 Use sweeping and water spray to clear forms; <u>or</u> C3 Use vacuum system to clear forms.	Use of high pressure air to clear forms may cause exceedance of Rule requirements.
Crushing	D1 Crushing asbestos containing material is expressly prohibited..	
Cut and fill	E1 Pre-water soils prior to cut and fill activities; <u>and</u> E2 Stabilize soil during and after cut and fill activities.	For large sites, pre-water with sprinklers or water trucks and allow time for penetration. Use water as necessary to keep dust down.
Demolition – mechanical/manual	F1 Stabilize wind erodible surfaces to reduce dust; <u>and</u> F2 Stabilize surface soil where support equipment and vehicles will operate; <u>and</u> F3 Stabilize loose soil and demolition debris.	Apply water in sufficient quantities to prevent the generation of visible dust.
Disturbed soil	G1 Stabilize disturbed soil throughout the construction site; <u>and</u> G2 Stabilize disturbed soil between structures	Limit vehicular traffic and disturbances on soils where possible. If interior block walls are planned, install as early as possible. Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes.

RULE 223-2 TABLE 1
BEST MANAGEMENT PRACTICE FOR ASBESTOS DUST MITIGATION
(Construction And Other Earthmoving Activities)

Source Category	Control Measure	Guidance
Earth-moving activities	<p>H1 Pre-apply water; <u>and</u></p> <p>H2 Re-apply water as necessary to maintain soils in a damp condition and to ensure that visible emissions do not exceed <u>25</u> feet or beyond property line in any direction; <u>and</u></p> <p>H3 Stabilize soils once earth-moving activities are complete.</p>	<p>Grade each project phase separately, timed to coincide with construction phase. Upwind fencing can prevent material movement on site.</p> <p>Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes. Suspend operations when winds generate visible dust emissions despite control measures</p>
Importing/exporting of bulk materials	<p>I1 Stabilize or adequately wet material while loading to reduce fugitive dust emissions; <u>and</u></p> <p>I2 Maintain at least six inches of freeboard on haul vehicles traveling off-site; <u>and</u></p> <p>I3 Stabilize or adequately wet material while transporting to reduce fugitive dust emissions; <u>and</u></p> <p>I4 Stabilize material while unloading to reduce fugitive dust emissions.</p>	<p>Use tarps or other suitable enclosures on haul trucks.</p> <p>Comply with track-out prevention/mitigation requirements.</p> <p>Provide water while loading and unloading to reduce visible dust plumes.</p> <p>Maintain trucks and cargo compartments, to prevent any spillage of material.</p> <p>If excavated material is classified as a hazardous waste/material, off-site transport must comply with pertinent State and Federal rules and regulations.</p>
Landscaping	<p>J1 Stabilize soils, materials and slopes.</p>	<p>Apply water to materials to stabilize. Maintain materials in a crusted condition. Maintain effective cover over materials. Stabilize sloping surfaces using soil binders until vegetation or ground cover can effectively stabilize the slopes. Hydroseed prior to rainy season.</p>
Road shoulder maintenance	<p>K1 Apply water to unpaved shoulders prior to clearing; <u>and</u></p> <p>K2 Apply chemical dust suppressants and/or other appropriate material in accordance with DOT specifications to maintain a stabilized surface after completing road shoulder maintenance.</p>	<p>Installation of curbing and/or paving of road shoulders can reduce recurring maintenance costs.</p> <p>Use of chemical dust suppressants can inhibit vegetation growth and reduce future road shoulder maintenance costs.</p>
Staging areas	<p>M1 Stabilize staging areas during use; <u>and</u></p> <p>M2 Stabilize staging area soils at project completion.</p>	<p>Limit size of staging area.</p> <p>Limit vehicle speeds to 15 miles per hour.</p> <p>Limit number and size of staging area entrances/exists.</p>

RULE 223-2 TABLE 1
BEST MANAGEMENT PRACTICE FOR ASBESTOS DUST MITIGATION
(Construction And Other Earthmoving Activities)

Source Category	Control Measure	Guidance
Stockpiles/Bulk Material Handling	N1 Stabilize stockpiled materials. N2 Stockpiles within 100 yards of off-site occupied buildings must not be greater than eight feet in height; or must have a road bladed to the top to allow water truck access or must have an operational water irrigation system that is capable of complete stockpile coverage.	Add or remove material from the downwind portion of the storage pile. Maintain storage piles to avoid slides.
Traffic areas for construction activities	O1 Stabilize or maintain adequate moisture on all off-road traffic and parking areas; <u>and</u> O2 Stabilize or maintain adequate moisture on all haul routes; <u>and</u> O3 Direct construction traffic over established haul routes.	Apply gravel/paving to all haul routes as soon as possible to all future roadway areas. Barriers can be used to ensure vehicles are only used on established parking areas/haul routes.
Trenching	P1 Stabilize surface soils where trencher or excavator and support equipment will operate; <u>and</u> P2 Stabilize soils at the completion of trenching activities.	Pre-watering of soils prior to trenching is an effective preventive measure. Washing mud and soils from equipment at the conclusion of trenching activities can prevent crusting and drying of soil on equipment.
Truck loading	Q1 Material must be adequately wet prior to loading; <u>and</u> Q2 Freeboard must be 6 inches or greater (VCS 23114)	Empty loader bucket such that no visible dust plumes are created. Ensure that the loader bucket is close to the truck to minimize drop height while loading.
Unpaved roads/parking lots	S1 Stabilize soils to meet the applicable performance standards (Surface Crusting); <u>and</u> S2 Limit vehicular travel to established unpaved roads (haul routes) and unpaved parking lots.	Restricting vehicular access to established unpaved travel paths and parking lots can reduce stabilization requirements.

RULE 223-2 TABLE 1
BEST MANAGEMENT PRACTICE FOR ASBESTOS DUST MITIGATION
(Construction And Other Earthmoving Activities)

Source Category	Control Measure	Guidance
Vacant land	T1 In instances where vacant lots are 0.10 acre or larger and have a cumulative area of 500 square feet or more that are driven over and/or used by motor vehicles and/or off-road vehicles, prevent motor vehicle and/or off-road vehicle trespassing, parking and/or access.	Installing barriers, curbs, fences, gates, posts, signs, shrubs, trees or other effective control measures to prevent access to motor or off-road vehicles.
Onsite Disposal of asbestiform containing soils	U1 If possible, place excavated soils into fills constructed elsewhere on the project	Fills with NOA content equal to or greater than 1.0%, or when visually evident fibrous materials likely to be asbestos are present, in residential landscaping areas must be covered by at least 24 inches of clean fill Document location and quantities of fills
Offsite disposal of asbestiform containing soils	V1 Management and disposition of excavated soils transported offsite must be in accordance with federal, state and local regulations.	For excavated soils transported offsite, information per Rule 223-2.6.D.3. <u>must</u> be documented by owner/operator and retained for a period of 3 years.
Post Construction Stabilization of Disturbed Areas	W1 Must be completed no later than 30 days following completion of the project.	Establishment of vegetative cover; <u>or</u> Placement of at least 3 inches of clean fill, Placement of a total of at least 12 inches, or maximum depth of irrigation improvements, whichever is higher, of clean fill in residential landscaping areas with NOA greater than 0.25%; <u>or</u> Paving, Foundations, Retaining Walls; <u>or</u> Other measures as approved by APCO.
Signage	X1 Post Warning Signs at the main entrance to the project for the duration of soil disturbance activities	Signs to be in compliance with current OSHA requirements Proposition 65 (H&S Code 25249.5-25249.13) may apply

RULE 223-2 TABLE 2
BEST MANAGEMENT PRACTICE FOR ASBESTOS DUST MITIGATION
(Bulk Material Handling)

Source Category	Control Actions
Handling Of Bulk Materials	A1 When handling bulk materials, apply water or chemical/organic stabilizers/suppressants;
Storage of Bulk Materials	B1 When storing bulk materials, comply with the conditions for a stabilized surface; <u>or</u> B2 Cover bulk materials stored outdoors with tarps, plastic or other suitable material and anchor in such a manner that prevents the cover from being removed by wind action; <u>or</u> B3 Construct and maintain wind barriers with less than 50% porosity. If utilizing fences or wind barriers, apply water or chemical/organic stabilizers/suppressants; <u>or</u> B4 Utilize a 3-sided structure with a height at least equal to the height of the storage pile and with less than 50% porosity.
On-Site Transporting of Bulk Materials	C1 Limit vehicular speed while traveling on the work site; <u>or</u> C2 Load all haul trucks such that the freeboard is not less than six (6) inches when material is transported across any paved public access road; <u>or</u> C3 Apply water to the top of the load; <u>or</u> C4 Cover haul trucks with a tarp or other suitable cover.
Off-Site Transporting of Bulk Materials	D1 Clean the interior of the cargo compartment or cover the cargo compartment before the empty truck leaves the site; <u>and</u> D2 Material must be adequately wet prior to loading; <u>and</u> D3 Prevent spillage or loss of bulk material from holes or other openings in the cargo compartment's floor, sides and/or tailgate; <u>and</u> D4 Load all haul trucks such that the freeboard is not less than six (6) inches when material is transported on any paved road, and apply water to the top of the load; or cover haul trucks with a tarp or other suitable cover. D5 If excavated material is classified as a hazardous waste/material, off-site transport must comply with pertinent State and Federal rules and regulations.
Outdoor Transport Of Bulk Materials With A Chute Or Conveyor:	E1 Fully enclose the chute or conveyor; <u>or</u> E2 Operate water spray equipment; <u>or</u> E3 Wash separated or screened materials to remove conveyed materials having an aerodynamic diameter of 10 microns or less.

RULE 223-2 TABLE 3
BEST MANAGEMENT PRACTICE FOR ASBESTOS DUST MITIGATION
(Removal and Prevention of Trackout)

Source Category	Control Actions
Removal of Trackout Material	A1 Manually wet sweeping and picking-up; <u>or</u> A2 Operating HEPA filter equipped vacuum device; <u>or</u> A3 Flushing with water, where the use of water will not result in adverse impacts on storm water drainage systems or violate any National Pollutant Discharge Elimination System permit program; <u>and</u> A4 <u>The use of blower devices, or dry rotary brushes or dry brooms is expressly prohibited.</u>
Frequency of Trackout Material Removal	B1 Visible trackout must be immediately removed from paved public roads; <u>and</u> B4 On interior paved roads trackout must be removed at least once per workday.
Trackout Prevention for Large Operations or Sites with more than 150 vehicle trips/day.	C1 Installation of grizzlies, or similar devices designed to remove dirt/mud from tires; <u>or</u> C2 Installation of gravel pad; <u>or</u> C3 Paving of interior roads.

RULE 223-2 TABLE 4
BEST MANAGEMENT PRACTICE FOR ASBESTOS DUST MITIGATION
(Blasting Activities)

Source Category	Control Measure	Guidance
Site Preparation (drilling, setting charges, burial of charges)	A1 Reduce dust from drilling operation A2 Pre-wet blast area A3 Cover charges to minimize dust	Control rate of drilling Apply water fog Place blast mats over charges Place soil mounds over charges Wet entire area prior to blasting
Blasting activities	B1 Dust cannot exceed 25 ft or cross the project property line	Conduct blasting on calm days Consider wind direction with respect to your property line, nearby residences and other receptors.
Post-Blasting Activities	C1 Follow Best Management Practices for all construction activities (Table 223-2, Table 1)	

**RULE 223-2 TABLE 5
DUST CONTROL MEASURES FOR LARGE OPERATIONS**

Source Category	Control Actions
Earth-moving (except construction cutting and filling areas, and mining operations)	<p>A1 Maintain soil moisture content at a minimum of 12 percent, as determined by ASTM method D-2216, or other equivalent method approved by the Air Pollution Control Officer. Two soil moisture evaluations must be conducted during the first three hours of active operations during a calendar day, and two such evaluations each subsequent four-hour period of active operations; <u>or</u></p> <p>A2 For any earth-moving which is more than 25 feet from all property lines, conduct watering as necessary to prevent visible dust emissions from exceeding 25 feet in length in any direction. Visible emissions must not extend beyond property boundary.</p>
Earth-moving: Construction fill areas:	<p>B1 Maintain soil moisture content at a minimum of 12 percent, as determined by ASTM method D-2216, or other equivalent method approved by the Air Pollution Control Officer. For areas which have an optimum moisture content for compaction of less than 12 percent, as determined by ASTM Method 1557 or other equivalent method approved by the Air Pollution Control Officer complete the compaction process as expeditiously as possible after achieving at least 70 percent of the optimum soil moisture content. Two soil moisture evaluations must be conducted during the first three hours of active operations during a calendar day, and two such evaluations during each subsequent four hour period of active operations.</p> <p>B2 For any earth-moving which is more than 25 feet from all property lines, conduct watering as necessary to prevent visible dust emissions from exceeding 25 feet in length in any direction. Visible emissions must not extend beyond property boundary.</p>
Earth-moving: Construction cut areas	<p>C1 Conduct watering as necessary to prevent any visible emissions from extending beyond property boundary.</p>
Disturbed surface areas: (except completed grading areas)	<p>D1 Apply dust suppression in sufficient quantity and frequency to maintain a stabilized surface. Any areas which cannot be stabilized, as evidenced by wind driven fugitive dust must have an application of water at least twice per day to at least 80 percent of the unstabilized area.</p>
Disturbed surface areas: Completed grading areas	<p>E1 Apply chemical stabilizers within five working days of grading completion; <u>or</u></p> <p>E2 Take actions F1 or F3 specified for inactive disturbed surface areas.</p>

**RULE 223-2 TABLE 5
DUST CONTROL MEASURES FOR LARGE OPERATIONS**

Source Category	Control Actions
Inactive disturbed surface areas	<p>F1 Apply water to at least 80 percent of all inactive disturbed surface areas on a daily basis when there is evidence of wind driven fugitive dust, excluding any areas which are inaccessible to watering vehicles due to excessive slope or other safety conditions; <u>or</u></p> <p>F2 Apply dust suppressants in sufficient quantity and frequency to maintain a stabilized surface; <u>or</u></p> <p>F3 Establish a vegetative ground cover within 21 days after active operations have ceased. Ground cover must be of sufficient density to expose less than 30 percent of unstabilized ground within 90 days of planting, and at all times thereafter; <u>or</u></p> <p>F4 Utilize any combination of control actions F1, F2 and F3 such that, in total, these actions apply to all inactive disturbed surface areas.</p> <p>F5 Establishment and maintenance of surface crusting sufficient to satisfy the test in Section 223-2.10.C</p> <p>F6 Approved mixture of tackifier and fiber mulch, applied per manufacturer's recommendation.</p>
Unpaved Roads	<p>G1 Water all roads used for any vehicular traffic at least once per every two hours of active operations or as often as necessary; <u>or</u></p> <p>G2 Apply a chemical stabilizer to all unpaved road surfaces in sufficient quantity and frequency to maintain a stabilized surface; <u>and</u></p> <p>G3 Restrict vehicle speeds to 15 miles per hour;</p>
Open storage piles	<p>H1 Apply chemical stabilizers; <u>or</u></p> <p>H2 Apply water to at least 80 percent of the surface area of all open storage piles on a daily basis when there is evidence of wind driven fugitive dust; <u>or</u></p> <p>H3 Install temporary coverings; <u>or</u></p> <p>H4 Install a three-sided enclosure with walls with no more than 50 percent porosity which extend, at a minimum, to the top of the pile. This option may only be used at aggregate-related plants or at cement manufacturing facilities.</p>
All Categories	<p>I1 Any other control measures approved by the Air Pollution Control Officer as equivalent to the methods specified in Table 5 may be used.</p>

RULE 223-2 TABLE 6
CONTINGENCY DUST CONTROL MEASURES FOR LARGE OPERATIONS

Source Category	Control Actions
Earth-moving	A1 Cease all active operations except for dust mitigation activities; or A2 Apply water to soil not more than 15 minutes prior to moving such soil; <u>and</u> A3 Apply water during soil moving or disturbance operations.
Disturbed surface areas	B1 On the last day of active operations prior to a weekend, holiday or any other period when active operations will not occur for not more than four consecutive days: apply water with a mixture of chemical stabilizer diluted to not less than 1/20 of the concentration required to maintain a stabilized surface for a period of six months; <u>or</u> B2 Apply chemical stabilizers prior to wind event; <u>or</u> B3 Apply water to all unstabilized disturbed areas 3 times per day. If there is any evidence of wind driven fugitive dust, watering frequency is increased to a minimum of four times per day; <u>or</u> B4 Take the actions specified in Table 5, control action F3; <u>or</u> B5 Utilize any combination of control actions B1, B2 and B3B such that, in total, these actions apply to all disturbed surface areas.
Unpaved roads	C1 Apply chemical stabilizers prior to wind event; <u>or</u> C2 Apply water twice per hour during active operation; <u>or</u> C3 Stop all vehicular traffic, except for dust mitigation equipment.
Open storage piles	D1 Apply water twice per hour; <u>or</u> D2 Install temporary coverings.
Bulk Material Transport	E1 Cover all haul vehicles; <u>or</u> E2 Freeboard must be 6 inches or greater (VCS 23114)
All Categories	F1 Any other control measures approved by the Air Pollution Control Officer as equivalent to the methods specified in Table 6 may be used.

Appendix E Plant Species

Plant Species Observed in the Project Area (April 6 and 13, May 3, 2005; May 9, June 7, June 12–14, and July 2, 2012)

Scientific Name	Common Name
ADOXACEAE	MUSKROOT FAMILY
<i>Sambucus nigra</i> ssp. <i>caerulea</i>	Blue elderberry
AGAVACEAE	AGAVE FAMILY
<i>Chlorogalum angustifolium</i>	Soap plant
<i>Chlorogalum pomeridianum</i>	Soap plant
ALISMATACEAE	WATER-PLANTAIN FAMILY
<i>Sagittaria latifolia</i>	Broad-leaf arrowhead
ALLIACEAE	ONION FAMILY
<i>Allium hyalinum</i>	Wild onion
ANACARDIACEAE	SUMAC FAMILY
<i>Toxicodendron diversilobum</i>	Poison oak
APIACEAE	CARROT FAMILY
<i>Anthriscus caucalis</i>	Bur chevril
<i>Conium maculatum</i> *†	Poison-hemlock
<i>Daucus carota</i> *	Queen Anne's lace
<i>Daucus pusillus</i>	American wild carrot
<i>Eryngium vaseyi</i>	Vasey's coyote-thistle
<i>Lomatium caruifolium</i> var. <i>denticulatum</i>	Caraway-leaved lomatium
<i>Lomatium macrocarpum</i>	Big seed biscuitroot
<i>Lomatium marginatum</i> var. <i>marginatum</i>	Butte desertparsley
<i>Sanicula bipinnata</i>	Poison sanicle
<i>Sanicula bipinnatifida</i>	Pacific snakeroot
<i>Sanicula crassicaulis</i>	Sanicle
<i>Scandix pecten-veneris</i> *	Venus' needle
<i>Torilis arvensis</i> *†	Torilis (hedge parsley)
APOCYNACEAE	DOGBANE FAMILY
<i>Asclepias cordifolia</i>	Purple milkweed
<i>Asclepias fascicularis</i>	Narrow-leaf milkweed
<i>Asclepias speciosa</i>	Showy milkweed
ASTERACEAE	SUNFLOWER FAMILY
<i>Achillea millefolium</i>	Common yarrow
<i>Agoseris grandiflora</i>	Giant mountain dandelion
<i>Agoseris heterophylla</i>	Mountain dandelion
<i>Ambrosia psilostachya</i>	Ragweed
<i>Artemisia douglasiana</i>	Mugwort
<i>Baccharis pilularis</i>	Coyote bush
<i>Carduus pycnocephalus</i> *†	Italian thistle

Scientific Name	Common Name
<i>Centaurea calcitrapa</i> *†	Purple star thistle
<i>Centaurea melitensis</i> *†	Tocalote
<i>Centaurea solstitialis</i> *†	Yellow star-thistle
<i>Chondrilla juncea</i> *†	Skeleton weed
<i>Cichorium intybus</i> *	Chicory
<i>Cirsium vulgare</i> *†	Bull thistle
<i>Ericameria arborescens</i>	Golden-fleece
<i>Erigeron canadensis</i>	Canada horseweed
<i>Erigeron divergens</i>	Fleabane daisy
<i>Erigeron philadelphicus</i>	Philadelphia fleabane
<i>Eriophyllum lanatum</i>	Common woolly sunflower
<i>Euthamia occidentalis</i>	Western goldenrod
<i>Grindelia camporum</i>	Gumplant
<i>Helenium puberulum</i>	Sneezeweed
<i>Hemizonella minima</i>	Opposite-leaved tarweed
<i>Holocarpha virgata</i>	Sticky tarweed
<i>Hypochaeris glabra</i> *†	Smooth cat's-ear
<i>Hypochaeris radicata</i> *†	Perennial cat's-ear
<i>Lactuca serriola</i> *	Prickly lettuce
<i>Lasthenia californica</i>	California goldfields
<i>Leontodon saxatilis</i> *	Hairy hawkbit
<i>Logfia filaginoides</i>	California cotton rose
<i>Logfia gallica</i> *	Herba impia
<i>Madia anomala</i>	White tarweed
<i>Madia elegans</i>	Common madia
<i>Madia exigua</i>	Little tarweed
<i>Matricaria discoidea</i> *	Pineapple weed
<i>Micropus californicus</i>	Cotton top
<i>Psilocarphus tenellus</i>	Slender woolly marbles
<i>Pseudognaphalium californicum</i>	Everlasting
<i>Pseudognaphalium luteoalbum</i> *	Common cudweed
<i>Senecio aronicoides</i>	Butterweed
<i>Senecio vulgaris</i>	Groundsel
<i>Silybum marianum</i> *†	Milk thistle
<i>Solidago vultina</i> ssp. <i>californica</i>	California goldenrod
<i>Sonchus asper</i> *	Prickly sowthistle
<i>Sonchus oleraceus</i> *	Common sowthistle
<i>Symphotrichum chilense</i>	Common California aster
<i>Symphotrichum foliaceum</i>	Leafybract aster
<i>Taraxacum officinale</i> *	Dandelion
<i>Tragopogon dubius</i> *	Goat's beard
<i>Wyethia angustifolia</i>	Narrow leaf mule ears
<i>Wyethia bolanderi</i>	Bolander's mule ears
<i>Wyethia helenioides</i>	Gray mule ears
<i>Wyethia mollis</i>	Woolly mule ears
<i>Xanthium spinosum</i>	Spiny cocklebur

Scientific Name	Common Name
<i>Xanthium strumarium</i>	Rough cocklebur
AZOLLACEAE	MOSQUITO FERN FAMILY
<i>Azolla filiculoides</i>	Mosquito fern
BETULACEAE	BIRCH FAMILY
<i>Alnus rhombifolia</i>	White alder
BORAGINACEAE	BORAGE FAMILY
<i>Amsinckia menziesii</i>	Rancher's fireweed
<i>Cryptantha circumscissa</i>	Western forget-me-not
<i>Cryptantha muricata</i>	Prickly popcorn flower
<i>Emmenanthe penduliflora</i>	Whispering bells
<i>Eriodictyon californicum</i>	Yerba santa
<i>Phacelia cirutaria</i>	Caterpillar phacelia
<i>Phacelia hastata</i>	Phacelia
<i>Phacelia tanacetifolia</i>	Lacy phacelia
<i>Plagiobothrys nothofulvus</i>	Rusty popcorn flower
<i>Plagiobothrys stipitatus</i>	Slender popcorn flower
BRASSICACEAE	MUSTARD FAMILY
<i>Brassica nigra*†</i>	Black mustard
<i>Hirschfeldia incana*†</i>	Shortpod mustard
<i>Lepidium didymum*</i>	Wart-cress
<i>Lepidium latifolium*†</i>	Broad-leaf pepper grass
<i>Brassica nigra*†</i>	Black mustard
<i>Camelina microcarpa*</i>	False flax
<i>Nasturtium officinale</i>	Water cress
<i>Rorippa curvipes</i>	Bluntleaf yellow cress
<i>Rorippa curvisiliqua</i>	Yellow cress
<i>Sinapis arvensis*†</i>	Charlock mustard
<i>Thysanocarpus radians</i>	Fringe pod
CAPRIFOLIACEAE	HONEYSUCKEL FAMILY
<i>Lonicera hispidula</i>	Pink honeysuckle
<i>Lonicera interrupta</i>	Chaparral honeysuckle
<i>Symphoricarpos albus</i> var. <i>laevigatus</i>	Snowberry
CARYOPHYLLACEAE	PINK FAMILY
<i>Cerastium glomeratum*</i>	Mouse-ear chickweed
<i>Petrorhagia dubia*</i>	Grass pink
<i>Silene gallica*</i>	Catchfly
<i>Spergularia rubra*</i>	Purple sandspurry
<i>Stellaria media*</i>	Common chickweed
CHENOPODIACEAE	GOOSEFOOT FAMILY
<i>Chenopodium album*</i>	Lamb's quarters
<i>Dysphania ambosioides</i>	Mexican tea
CONVOLVULACEAE	MORNING-GLORY FAMILY
<i>Calystegia occidentalis</i>	Western morning glory
<i>Convolvulus arvensis*†</i>	Bindweed

Scientific Name	Common Name
<i>Cuscuta</i> sp.†	Dodder
CRASSULACEAE	STONECROP FAMILY
<i>Crassula connate</i>	Pygmy weed
<i>Sedum obtusatum</i>	Stonecrop
CUCURBITACEAE	GOURD FAMILY
<i>Marah watsonii</i>	Wild cucumber
CUPRESSACEAE	CYPRESS FAMILY
<i>Sequoia sempervirens</i>	Coast redwood
CYPERACEAE	SEDGE FAMILY
<i>Carex</i> sp.	Sedge
<i>Cyperus eragrostis</i>	Tall flatsedge
<i>Cyperus esculentus</i> †	Yellow nut grass
<i>Eleocharis acicularis</i>	Least spikerush
<i>Eleocharis macrostachya</i>	Creeping spikerush
<i>Eleocharis parishii</i>	Parish's spikerush
<i>Scirpus microcarpus</i>	Small fruited bulrush
EQUISETACEAE	HORSETAIL FAMILY
<i>Equisetum arvense</i>	Field horsetail
ERICACEAE	HEATH FAMILY
<i>Arctostaphylos manzanita</i>	Manzanita
<i>Arctostaphylos patula</i>	Greenleaf manzanita
<i>Arctostaphylos viscida</i>	Manzanita
EUPHORBIACEAE	SPURGE FAMILY
<i>Chamaesyce ocellata</i> ssp. <i>ocellata</i>	Contura Creek sandmat
<i>Croton setigerus</i>	Turkey mullein
<i>Euphorbia oblongata</i> *†	Eggleaf spurge
<i>Euphorbia peplus</i> *	Petty spurge
<i>Euphorbia spathulata</i>	Spurge
FABACEAE	LEGUME FAMILY
<i>Astragalus gambelianus</i>	Locoweed
<i>Acmispon americanus</i>	Spanish clover
<i>Acmispon glaber</i>	Deerweed
<i>Acmispon nevadensis</i>	Sierra Nevada lotus
<i>Acmispon wrangelianus</i>	Chilean trefoil
<i>Bidens frondosa</i>	Devil's beggar-ticks
<i>Cercis occidentalis</i>	Western redbud
<i>Hosackia crassifolia</i> var. <i>crassifolia</i>	Broad leaved lotus
<i>Lotus corniculatus</i> *	Birdsfoot trefoil
<i>Lotus unifoliolatus</i>	American birdsfoot trefoil
<i>Lupinus albifrons</i>	Bush lupine
<i>Lupinus argenteus</i>	Silvery lupine
<i>Lupinus benthamii</i>	Bentham lupine
<i>Lupinus bicolor</i>	Bicolored lupine

Scientific Name	Common Name
<i>Lupinus microcarpus</i> var. <i>densiflorus</i>	Dense-flowered lupine
<i>Lupinus nanus</i>	Sky lupine
<i>Medicago polymorpha</i> *†	Bur clover
<i>Medicago sativa</i>	Alfalfa
<i>Trifolium campestre</i> *	Hop clover
<i>Trifolium depauperatum</i>	Sack clover
<i>Trifolium dubium</i> *	Shamrock clover
<i>Trifolium hybridum</i> *	Alsike clover
<i>Trifolium glomeratum</i> *	Clover
<i>Trifolium hirtum</i> *†	Rose clover
<i>Trifolium microdon</i>	Flat-bottom clover
<i>Trifolium subterraneum</i> *	Subterranean clover
<i>Trifolium variegatum</i>	White-tip clover
<i>Trifolium wildenovii</i>	Tom cat clover
<i>Vicia sativa</i> *	Spring vetch
<i>Vicia villosa</i> *	Winter vetch
FAGACEAE	OAK FAMILY
<i>Quercus berberidifolia</i>	Scrub oak
<i>Quercus douglasii</i>	Blue oak
<i>Quercus kelloggii</i>	Black oak
<i>Quercus lobata</i>	Valley oak
<i>Quercus wislizenii</i>	Interior live oak
GENTIANACEAE	GENTIAN FAMILY
<i>Centaureum tenuiflorum</i>	Monterey centaury
<i>Cicendia quadrangularis</i>	Gentian
<i>Zeltnera muehlenbergii</i>	Muehlenberg's centaury
GERANIACEAE	GERANIUM FAMILY
<i>Erodium botrys</i> *	Filaree
<i>Erodium cicutarium</i> *	Filaree
<i>Geranium carolinianum</i>	Carolina geranium
<i>Geranium dissectum</i> *†	Cut-leaved geranium
<i>Geranium molle</i> *	Hairy geranium
HYPERICACEAE	ST. JOHN'S WORT FAMILY
<i>Hypericum concinnum</i>	Goldwire
<i>Hypericum mutilum</i>	Dward St. John's wort
<i>Hypericum perforatum</i> *†	Klamath weed
IRIDACEAE	IRIS FAMILY
<i>Iris macrosiphon</i>	Ground iris
<i>Sisyrinchium bellum</i>	Blue-eyed grass
ISOETACEAE	QUILLWORT FAMILY
<i>Isoetes orcuttii</i>	Orcutt's quillwort
JUGLANDACEAE	WALNUT FAMILY
<i>Juglans californica</i>	California black walnut
JUNCACEAE	RUSH FAMILY

Scientific Name	Common Name
<i>Juncus balticus</i> ssp. <i>ater</i>	Baltic rush
<i>Juncus bufonius</i>	Toad rush
<i>Juncus capitatus</i> *	Leafy bract rush
<i>Juncus effusus</i>	Bog rush
<i>Juncus tenuis</i>	Slender rush
<i>Juncus xiphioides</i>	Iris-leaf rush
<i>Luzula comosa</i>	Wood rush
<i>Luzula subsessilis</i>	Wood rush
LAMIACEAE	MINT FAMILY
<i>Marrubium vulgare</i> *†	Common horehound
<i>Melissa officinalis</i>	Lemon balm
<i>Mentha arvensis</i>	Field mint
<i>Mentha x. piperita</i> *	Peppermint
<i>Mentha pulegium</i>	Pennyroyal
<i>Mentha spicata</i> *	Spearmint
<i>Monardella villosa</i>	Coyote mint
<i>Pogogyne zizyphoroides</i>	Sacramento mesamint
<i>Salvia sonomensis</i>	Creeping sage
<i>Scutellaria bolanderi</i> ssp. <i>bolanderia</i>	Sierra skullcap
<i>Scutellaria californica</i>	California skullcap
<i>Stachys ajugoides</i>	Ajuga hedge-nettle
<i>Stachys albens</i>	White-stem hedgenettle
<i>Trichostemma lanceolatum</i>	Vinegar weed
LILIACEAE	LILY FAMILY
<i>Calochortus albus</i>	White globe lily
<i>Calochortus luteus</i>	Yellow mariposa lily
LINACEAE	FLAX FAMILY
<i>Linum bienne</i> *	Narrow-leaved flax
<i>Linum lewisii</i>	Western blue flax
<i>Hesperolinon spergulinum</i>	Annual flax
<i>Hesperolinon</i> sp.	Dwarf flax
LYTHRACEAE	LOOSESTRIFE FAMILY
<i>Lythrum hyssopifolia</i> *†	Hyssop loosestrife
MALVACEAE	MALLOW FAMILY
<i>Sidalcea hartwegii</i>	Valley checkerbloom
MORACEAE	MULBERRY FAMILY
<i>Ficus carica</i> *†	Fig
MYRSINACEAE	MYRSINE FAMILY
<i>Anagallis arvensis</i> *	Scarlet pimpernel
OLEACEAE	OLIVE FAMILY
<i>Fraxinus latifolia</i>	Oregon ash
<i>Fraxinus</i> sp.	Ash
ONAGRACEAE	EVENING PRIMROSE FAMILY
<i>Camissonia hirtella</i>	Hairy suncup

Scientific Name	Common Name
<i>Clarkia biloba</i> ssp. <i>biloba</i> (intergrade)	Two-lobed clarkia
<i>Clarkia biloba</i> ssp. <i>brandegeae</i> (intergrade)	Brandegee's Clarkia
<i>Clarkia purpurea</i> ssp. <i>purpurea</i>	Four-spot clarkia
<i>Clarkia unguiculata</i>	Elegant clarkia
<i>Clarkia williamsonii</i>	Farewell-to-spring
<i>Epilobium brachycarpum</i>	Panicled willow-herb
<i>Epilobium ciliatum</i>	Hairy willow-herb
<i>Epilobium densiflorum</i>	Dense-flowered boisduvalia
<i>Epilobium torreyi</i>	Brook spike primrose
<i>Ludwigia</i> sp.	Water primrose
OROBANCHACEAE	BROOMRAPE FAMILY
<i>Castilleja attenuata</i>	Valley tassels
<i>Castilleja densiflora</i>	Owl's clover
<i>Castilleja exserta</i>	Purple owl's-clover
<i>Castilleja lineariloba</i>	Thin-lobed owl's clover
<i>Castilleja</i> sp.	Paintbrush
<i>Triphysaria eriantha</i>	Butter 'n eggs
<i>Triphysaria pusilla</i>	Dwarf owl's clover
OXALIDACEAE	OXALIS FAMILY
<i>Oxalis</i> sp.	Sorrel
PAPAVERACEAE	POPPY FAMILY
<i>Eschscholzia californica</i>	California poppy
PHRYMACEAE	LOPSEED FAMILY
<i>Mimulus aurantiacus</i>	Bush monkey flower
<i>Mimulus cardinalis</i>	Cardinal monkey flower
<i>Mimulus guttatus</i>	Common large monkey-flower
PINACEAE	PINE FAMILY
<i>Pinus sabiniana</i>	Gray pine
PLANTAGINACEAE	PLANTAIN FAMILY
<i>Gratiola ebracteata</i>	Bractless hedge hyssop
<i>Hippuris vulgaris</i>	Marestail
<i>Plantago erecta</i>	Plantain
<i>Plantago lanceolata</i> *	English plantain
<i>Plantago major</i> *	Broad-leaf plantain
<i>Veronica americana</i>	Brooklime
<i>Veronica anagallis-aquatica</i> *	Water speedwell
<i>Veronica peregrina</i> ssp. <i>xalapensis</i>	Purslane speedwell
POACEAE	GRASS FAMILY
<i>Aegilops triuncialis</i> *†	Barbed goatgrass
<i>Aira caryophyllea</i> *	Hairgrass
<i>Avena barbata</i> *†	Slender wild oat
<i>Avena fatua</i> *†	Wild oat
<i>Brachypodium distachyon</i> *	False brome
<i>Briza minor</i> *	Little quaking grass
<i>Bromus carinatus</i> var. <i>carinatus</i>	California brome

Scientific Name	Common Name
<i>Bromus catharticus</i> *	Rescue grass
<i>Bromus diandrus</i> *†	Ripgut brome
<i>Bromus hordeaceus</i> *†	Soft brome
<i>Bromus madritensis</i> ssp. <i>rubens</i> *†	Red brome
<i>Bromus laevipes</i>	Chinook brome
<i>Bromus tectorum</i> *†	Cheatgrass
<i>Cynodon dactylon</i> *†	Bermuda grass
<i>Cynosurus echinatus</i> *†	Hedgehog dog-tail grass
<i>Dactylis glomerata</i> *†	Orchard grass
<i>Elymus caput-medusae</i> *†	Medusahead grass
<i>Elymus elymoides</i> var. <i>californicus</i>	Bottlebrush grass
<i>Elymus glaucus</i>	Blue wild-rye
<i>Festuca bromoides</i> *	Brome fescue
<i>Festuca microstachys</i>	Vulpia
<i>Festuca myuros</i> *†	Rat-tail vulpia
<i>Festuca perennis</i> *†	Italian ryegrass
<i>Gastridium phleoides</i> *	Nit grass
<i>Holcus lanatus</i> *†	Velvet grass
<i>Hordeum brachyantherum</i> ssp. <i>californicum</i>	California barley
<i>Hordeum marinum</i> ssp. <i>gussoneanum</i> *†	Mediterranean barley
<i>Hordeum murinum</i> ssp. <i>leporinum</i> *†	Foxtail
<i>Leersia oryzoides</i>	Rice cutgrass
<i>Melica californica</i>	California melic
<i>Muhlenbergia rigens</i>	Deergrass
<i>Paspalum dilatatum</i> *	Dallis grass
<i>Phalaris aquatica</i> *†	Harding grass
<i>Phalaris lemmonii</i>	Lemon's canary grass
<i>Poa annua</i> *	Annual bluegrass
<i>Poa bulbosa</i> *	Bluegrass
<i>Poa pratensis</i> *	Kentucky bluegrass
<i>Polypogon maritimus</i> *	Mediterranean rabbits-foot grass
<i>Polypogon monspeliensis</i> *†	Annual rabbits-foot grass
<i>Stipa lemmonii</i>	Lemon's needlegrass
<i>Stipa lepida</i>	Foothill needle grass
<i>Stipa pulchra</i>	Purple needle grass
POLEMONIACEAE	PHLOX FAMILY
<i>Gilia</i> sp.	Gilia
<i>Leptosiphon bicolor</i>	True baby stars
<i>Navarretia intertexta</i>	Needle leaf navarretia
<i>Navarretia pubescens</i>	Purple navarretia
<i>Navarretia tagetina</i>	Marigold navarretia
POLYGALACEAE	BUCKWHEAT FAMILY
<i>Polygala californica</i>	Milkwort
<i>Polygala cornuta</i> var. <i>cornuta</i>	Sierra milkwort

Scientific Name	Common Name
POLYGONACEAE	PURSLANE FAMILY
<i>Chorizanthe</i> sp.	Spineflower

1.0 INTRODUCTION

This Oak Resources Technical Report was prepared to satisfy the requirements of the El Dorado County (County) Oak Resources Management Plan (ORMP), adopted in 2017. The purpose of the report is to identify the inventory of individual native oak trees and oak woodland on the Village of Marble Valley Specific Plan Project (Project) site and address native oak tree impacts and proposed mitigation for the Project. This report provides Project oak resources impacts and mitigation acceptable under the County ORMP.

This Oak Resources Technical Report has been prepared as a program-level analysis, and focuses primarily on the changes to oak resources that would occur because of full Project implementation and examines all phases of the Project. Ultimately, this report will be used by both the County and applicants as a tool in evaluating oak resource impacts and possible mitigation methods at the time of future, individual tentative map proposals. At the time of tentative map application, individual development proposals within the Specific Plan area will be required to prepare a refined, land-specific oak resource technical report consistent with the County ORMP. This redundancy of analysis is intended to account for natural dynamics associated with oak woodlands over the planned project time horizon, such as ongoing tree growth and revegetation and natural mortality.

1.1 Project Description and Location

The Village of Marble Valley Specific Plan area encompasses approximately 2,341 acres south of U.S. Highway 50 (US 50), east of Bass Lake Road, and west of Cambridge Road (Figure 1. *Project Location and Vicinity*). The Project site is primarily hilly terrain vegetated with oak savannah, with lowland riparian oak woodland along Marble and Deer creeks, and chaparral on several southern aspect hill slopes (Figure 2. *Vegetation Communities*). The elevation of the site ranges from approximately 680 to 1,300 feet above mean sea level (MSL). Marble Creek enters the area from the northern boundary of the property, and flows in a southerly direction into Deer Creek, which flows from east to west through the southern portion of the site. The hills are drained by various intermittent drainages and seasonal wetland swales. There are two former limestone quarries in the northern portion of the Project area.

The Project is located within portions of Sections 7, 8, 9, 16, 17, 20, and 21, of Township 9 North, Range 9 East of the "Clarksville, California", "Shingle Springs, California", "Folsom Southeast, California", and "Latrobe, California" 7.5-minute topographic quadrangles (U.S. Geological Survey [USGS] 1978, 1973a, 1980, 1973b). The Project is located at approximately 38° 39' 00" North and 121° 01' 15" West within the Upper Cosumnes Watersheds (USGS Hydrological Unit Code #18040013).

The Project proposes a mixed-use sustainable community, with a variety of residential housing types, commercial uses and public facilities including a Village Center, two public schools, vineyards, a wine and agricultural center, a historic park, other public and private parks, and expansive permanent open space and trails (see Figure 3. *Land Use Plan*). In addition, offsite infrastructure and other improvements—roads and water and wastewater line extensions as well as oak woodland restoration—would be needed to support the proposed Project. These areas are referred to collectively as the offsite infrastructure improvement areas and involve the areas listed below.

- A new connection of Marble Valley Parkway to the Bass Lake Road interchange with US 50 (Marble Valley Parkway/Bass Lake Road).
- A new section of Marble Valley Parkway between the east and west sides of the northern portion of the project site (Marble Valley Parkway connection).
- Extension of the new Marble Valley Parkway access road to the Cambridge Road interchange with US 50 (Marble Valley Parkway/Cambridge Road).
- Interim improvements to the US 50/Cambridge Road interchange.
- Interim improvements to the US 50/Bass Lake Road interchange.
- Interim potable water improvements for Phase I within roadways.
- New water transmission lines along Bass Lake and Cambridge Roads.
- An area east of the project area that encompasses two infrastructure components:
 - Extensions of water and wastewater lines to connect to existing El Dorado Irrigation District (EID) infrastructure (EID water [potentially recycled water] and wastewater lines).
 - Potential extension of the new Lime Rock Valley Road to Deer Creek Road.
- In addition, extensions to connect to electricity and natural gas services would be necessary to serve the Project. These dry utility connections would be constructed by PG&E.
- PG&E electricity service would be extended from a 21-kilovolt (kV) single-phase overhead line connecting to two existing substations, Clarksville to the west and Shingle Springs to the east.
- PG&E may extend service to the Project area to provide natural gas service. The connections to the Project area would follow Bass Lake Road or Cambridge Road.

1.2 El Dorado County Oak Tree Permit and Mitigation Requirements

Forest and oak woodland resources, as well as individual native oak trees, are protected by Objective 7.4.4 of the El Dorado County General Plan, which states:

Protect and conserve forest and woodland resources for their wildlife habitat, recreation, water production, domestic livestock grazing, production of sustainable flow or wood products, and aesthetic values (El Dorado County 2009).

Policy 7.4.4.4 of the General Plan (El Dorado County 2009; Revised 2015) specifies that mitigation requirements for impacts to oak resources (oak woodlands, individual native oak trees, and Heritage Trees) shall be quantified and identified by a certified arborist or biologist.

The Implementation Measure of Policy 7.4.4.4 directed the County to develop and adopt the Oak Resources Management Plan (ORMP) (El Dorado County 2017), which addresses the following:

- Mitigation standards for oak resources impacts;

- Definitions of exempt projects and actions;
- Technical report requirements;
- Oak resources mitigation options and standards;
- Heritage Tree mitigation standards; and
- Oak resources mitigation monitoring and reporting requirements.

The County ORMP, adopted in 2017, serves multiple purposes. It defines the County's conservation strategy for oak resources and provides a framework for mitigating impacts to oak resources. It also complies with Implementation Measure CO-P and constitutes the oak portion of the County's Biological Resources Mitigation Program (General Plan Policy 7.4.2.8).

The policy of the County is to preserve native oak resources when feasible, through the review of all proposed development activities where such trees are present on either public or private property, while at the same time recognizing individual rights to develop private property in a reasonable manner. As such, the County requires mitigation for impacts to oak woodlands, individual native oak trees, and Heritage Trees. The ORMP defines a Heritage Tree as a native oak tree measuring 36 inches diameter at breast height (DBH) or greater. According to the ORMP, there are six primary native oak tree species in El Dorado County, including blue oak (*Quercus douglasii*), valley oak (*Quercus lobata*), California black oak (*Quercus kelloggii*), interior live oak (*Quercus wislizeni*), canyon live oak (*Quercus chrysolepis*), and Oregon oak (*Quercus garryana*). Additionally, one native hybrid between California black oak and interior live oak exists, known as oracle oak (*Quercus x morehus*). These oak species comprise the County's oak woodlands and also occur outside of oak woodlands as isolated individuals or small groups.

Per the requirements of the ORMP, a tree removal permit is required for discretionary and ministerial (e.g., building permits) projects to authorize removal of any trees that are a component of an oak woodland and any individual native oak tree not located within an oak woodland. A tree removal permit is also required for removal of any Heritage Tree. An oak resources technical report must accompany any tree removal permit application submitted to the County, which may impose such reasonable conditions of approval as are necessary to protect the health of existing oak trees, the public, and the surrounding property. Oak tree removal permit review will be integrated into the environmental review process for discretionary projects or may be processed as an administrative permit for ministerial projects.

Oak Woodland Mitigation

Onsite retention of oak woodlands is incentivized by the ORMP. Projects impacting up to 50% of total oak woodlands mitigate for impacts at a 1:1 ratio. Projects impacting between 50.1-75% must mitigate for impacts at 1.5:1 and projects impacting greater than 75% of their oak woodlands must mitigate at 2:1. Mitigation for oak woodlands may occur using one or more of the following options:

1. Offsite deed restriction or conservation easement acquisition and/or acquisition in fee title by a land conservation organization for purposes of offsite oak woodland conservation;
2. In-lieu fee payment;

3. Replacement planting onsite within an area subject to a deed restriction or conservation easement;
4. Replacement planting offsite within an area subject to a conservation easement; or
5. A combination of numbers 1 through 4 above.

Consistent with California PRC 21083.4, replacement planting shall not account for more than 50 percent of the oak woodland mitigation requirement.

Individual and Heritage Trees Mitigation

Mitigation for removal of individual native oak trees is to be based on an inch-for-inch replacement standard (defined in Section 2.4 of the ORMP). Mitigation for removal of Heritage Trees is based on an inch-for-inch replacement standard at a 3:1 ratio. Options for individual native oak tree and Heritage Tree impact mitigation requirements include:

1. Replacement planting onsite within an area subject to a deed restriction or conservation easement;
2. Replacement planting offsite within an area subject to a conservation easement or acquisition in fee title by a land conservation organization;
3. In-lieu fee payment; or
4. A combination of numbers 1 through 3 above.

For impacts to individual native oak trees that are not otherwise mitigated, replacement plantings are required to be calculated based upon an inch-for-inch replacement of removed individual native oak trees. The total of replacement trees must have a combined diameter of the tree(s) removed. Replacement tree species must be the same proportion as those removed. Replacement trees are required to be planted onsite and monitored and maintained for a period of seven years, calculated from the day of planting. Offsite replacement plantings may be permitted, with County approval, preferably in proximity, and/or in connection with, oak woodlands contiguous to the project site or within or adjacent to a Priority Conservation Area (PCA) or an Important Biological Corridor as designated in the General Plan or important ecological area as identified in the Initial Inventory and Mapping. Replacement plantings must be inspected, maintained and documented consistent with requirements for mitigation maintenance, monitoring, and reporting.

Replacement tree sizes may vary and may include acorn plantings, based on documentation of inch-for-inch replacement consistency. **Table 1** identifies replacement tree size options and associated quantity of trees, by size, required to meet the inch-for-inch replacement standard.

Replacement Size Trees	Number of Trees Required Per Inch of Trunk Diameter Removed
Acorn	3
1-Gallon / Tree Pot 4	2
5-Gallon	1.5*
15-Gallon	1

*Quantity of replacement trees to be rounded up to the nearest whole number

If acorns are used, they must be planted at a 3:1 ratio (three acorns for every one inch of trunk diameter removed) under the direction of a qualified professional. Acorn planting must not exceed 25 percent of any project's tree planting total. If one-gallon/Tree Pot 4-sized containers are used, they must be planted at a 2:1 ratio (two container trees for every one inch of trunk diameter removed). If five-gallon-sized containers are used, they must be planted at a 1.5:1 ratio (1.5 container trees for every one inch of trunk diameter removed). Finally, if 15-gallon-sized containers are used, they must be planted at a 1:1 ratio (one container tree for every one inch of trunk diameter removed).

The replacement planting area is required to be suitable for tree planting, must not conflict with current or planned land uses, and must be large enough to accommodate replacement plantings up to a maximum density of 200 trees per acre. Replacement plantings are required to be inspected, maintained and documented consistent with the requirements for mitigation maintenance, monitoring, and reporting. For impacts to Heritage Trees, replacement plantings are required to adhere to the standards identified for individual native oak trees; however, replacement totals must be calculated based upon an inch-for-inch replacement at a 3:1 ratio.

Oak resources replacement planting plans are required to be prepared for all replacement planting efforts (onsite and offsite) by a qualified professional. Replacement planting plans must address the following:

- Consistency with the accepted native oak tree planting standards, including those outlined in *Regenerating Rangeland Oaks in California*, *How to Grow California Oaks*, *How to Collect, Store and Plant Acorns*, and other publications and protocols that may be established by the University of California, Division of Agriculture and Natural Resources. (ORMP 2017.)
- The suitability of the site must be demonstrated with soil information, aerial photography, or other resources.
- The density of replanting must be determined by the qualified professional, based on accepted practice and current research, up to a maximum density of 200 trees per acre.
- The intent of the replacement planting plan is to provide replacement oak trees or acorns with a similar mix of species as those removed, however, the species may vary based on site specific conditions, as determined by the qualified professional.

- Acorns or container trees for replanting must be from local sources, when available, to maintain local genetic strains.
- Replacement planting must not be located within the 100-foot defensible space zone from an existing or proposed structure unless otherwise consistent with CAL FIRE's defensible space guidelines and fuels reduction requirements mandated under PRC 4291.
- Replacement plantings are required to be maintained in a manner determined by the Qualified Professional, based on the site-specific conditions, which may include weed control, irrigation, tree protection, pest management, and/or fertilization.
- The replacement planting plan is required to identify the frequency and methods of maintenance and monitoring, as well as contingencies or alternatives if the success criteria are not met annually or at the end of the monitoring term along with a means to ensure compliance with the replacement planting plan. The monitoring term is seven years (PRC 21083.4).
- Best Management Practices (BMPs) for protection of retained oaks during and after construction (refer to Appendix D of the ORMP).
- An estimate of the total costs associated with implementation of the replacement plan.

1.3 Purpose of This Oak Resources Technical Report

The ORMP requires that the Project applicant prepare an Oak Resources Technical Report for the Project, which will address impacts to oak woodlands and individual oak trees and outlines plans for oak resource mitigation. This document addresses the requirements of the ORMP. This Oak Resources Technical Report was prepared by Seth Myers (International Society of Arboriculture [ISA]-certified Arborist [WE-7501A]) and provides the following:

- A map of oak woodland habitat across the Project and a discussion of woodland impacts;
- A map of the inventoried native oak tree individuals outside the oak woodland anticipated to be impacted (i.e., removed) by the Project;
- A discussion of the relative importance of the Project's native oak tree individuals as habitat for regionally occurring wildlife species and as wildlife corridors;
- A discussion of how the Project will conform to the requirements of the ORMP;
- Project avoidance, minimization, and/or compensation for impacts on oak tree individuals;
- Recommendations for tree protection during development; and
- Mitigation planting, monitoring, and reporting.

2.0 OAK RESOURCES TECHNICAL REPORT

This report discusses the method used to identify oak woodlands and woodland impacts within the plan area and identifies the existing native oak tree individuals within the Project that are anticipated to be affected by the Project.

2.1 Oak Woodland Resources

Oak Woodland Mapping Method

Vegetation mapping was conducted by ECORP biologists concurrently with the preparation of the Biological Resource Study and Important Habitat Mitigation Plan for the Project site in 2014 (ECORP 2014). Vegetation community classifications were based on the classification systems presented in *A Manual of California Vegetation*, Second Edition (Sawyer et al. 2009), *Preliminary Descriptions of the Terrestrial Natural Communities of California* (Holland 1986), and *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer Jr. 1988).

Due to the quantity of oak trees within the Project, a traditional arborist survey (including tree inventory) was not conducted. Instead, a remote sensing-based canopy mapping approach was implemented. Oak woodlands were mapped as part of a vegetation community mapping exercise using aerial photographs and Light Detection and Ranging (lidar) data and total oak canopy was mapped using hyperspectral imaging and lidar technology. Oak woodland polygons were field verified by an ECORP arborist and biologists conducting surveys of individual oak trees of the Project during individual oak tree surveys conducted between the end of April and beginning of May in 2018.

Oak Woodland Mapping Results

Across the entire 2,341-acre site, a total of 60 acres of blue oak savannah, 765 acres of open blue oak woodland, and 1,063 acres of closed-canopy blue oak woodland was mapped for a total of 1,888 acres of oak woodland. An additional 26 acres of valley foothill riparian habitat was mapped. Other habitats include annual grassland (167 acres), white leaf manzanita chaparral (208 acres), wetlands (40 acres) and disturbed/developed (13 acres).

2.2 Individual Oak Tree Resources

On April 23 and 30, 2018, and May 1-3, 2018, ECORP Consulting, Inc. performed a tree survey within the Project and inventoried all existing onsite oak tree individuals outside of oak woodland areas identified above and greater than six inches within the Project impact area. As discussed in Section 1.2, six native oak species and one naturally occurring hybrid oak species are recognized as sensitive natural resources in the county, and impacts to them must be mitigated to comply with the ORMP.

Individual Oak Tree Mapping and Inventory Method

The Project site was surveyed on foot and the seven oak trees species identified in the ORMP were inventoried. Physical attribute information was recorded about each inventoried tree, which included (1) DBH, (2) approximate height, (3) drip line radius, and (4) health/condition (normal, fair, poor) (see

Attachment B). The on-foot survey included a detailed visual inspection of the inventoried oak trees. Each tree was examined from every direction to identify pertinent conditions. Inspection tools employed included diameter tape and binoculars to examine the crown for defect indicators. The definitions of each tree condition rating are as follows:

<p>Normal</p>	<ul style="list-style-type: none"> ■ No trunk or root cavities or injuries present ■ No indication of hollowness ■ Root crown is at or slightly above grade ■ No decay present except for small stubs ■ Strong structure ■ Tapered trunk ■ No fungus evident 	<ul style="list-style-type: none"> ■ Below average amount of dead limbs ■ No co-dominant branching ■ No large callused areas, callusing intact ■ No evidence of large-scale insect infestation ■ Average growth rate ■ No excessive limb weight ■ Normal foliage, tree not suppressed
<p>Fair</p>	<ul style="list-style-type: none"> ■ No decay in the root crown and no major decay in the truck or limbs ■ Small cavities may be present ■ No fungus evident ■ Some small to moderate callusing injuries may be present 	<ul style="list-style-type: none"> ■ Some suppression or crowded growing conditions present ■ Average amount of dead wood limbs ■ Small cavities may be present ■ Foliage size, color, and density may vary
<p>Poor (indication that trees are weakened and dying)</p>	<ul style="list-style-type: none"> ■ Significant cavities, dead areas, and decay present ■ Tree structurally defective ■ Decay present in the root crown or base of trunk ■ Fungus bodies present indicating internal decay 	<ul style="list-style-type: none"> ■ Dead limbs above normal ■ Co-dominant branching with included bark present ■ Foliage is below average in size and color ■ Pest damage may be present

Individual Oak Tree Mapping Results

During the survey, 101 valley oak tree individuals, 36 interior live oak individuals, 300 canyon live oak individuals, 4 black oak individuals, 4 oracle oak tree individuals, and 207 blue oak tree individuals were inventoried onsite and offsite within the areas that will be impacted by the Project. An additional 77 inaccessible tree individuals were inventoried, the majority of these identified as interior live oak individual. As previously described, blue oaks, valley oaks, black oaks, interior live oaks, canyon live oaks, Oregon oaks, and oracle oaks are protected under the ORMP. Therefore, for the purposes of this report, these species are accounted for as part of the Project mitigation requirements.

In total, 128 Heritage Trees were inventoried: 16 valley oak trees, 9 interior live oaks, 71 canyon live oaks, 1 black oak tree, 1 oracle oak tree, and 30 blue oaks.

A list of all inventoried oak trees that are anticipated to be impacted by the Project are included in Attachment B and shown in Figure 4.

2.3 Impact Summary

As previously described, of the total 1,888 acres of oak woodland spanning the entire Project site (60 acres of blue oak savannah, 765 acres of open blue oak woodland, and 1,063 acres of closed-canopy blue oak woodland), 693.1 acres (36.7% of all site woodland) could be impacted because of the Project (see Figure 4). As previously described, projects impacting up to 50% of total oak woodlands mitigate for impacts at a 1:1 ratio.

Furthermore, up to 11,369 inches of individual native oak trees could be affected because of the Project (1,576 inches of valley oaks, 541 inches of interior live oaks, 4,385 inches of canyon live oaks, 61 inches of black oaks, 74 inches of oracle oaks, 2,848 inches of blue oaks, and 1,884 inches of inaccessible oak trees, the majority of which are interior live oaks). Additionally, up to 6,627.5 inches of individual Heritage Trees could be affected (719 inches of valley oaks, 488 inches of interior live oaks, 3,901.5 inches of canyon live oaks, 44 inches of black oak, 54 inches of oracle oaks, 1,383 inches of blue oaks, and 38 inches of inaccessible oak tree). See **Table 2** for a summary of total anticipated Project impacts.

Table 2. Oak Resource Impacts			
Resource Type	Onsite Acres/Inches Impacted	Offsite Acres/Inches Impacted	Total Acres/Inches Impacted
Oak Woodland			
Total Oak Woodlands Onsite & Offsite (acres)	689.6	3.5	693.1
Individual Native Oak Trees			
Valley Oak (<i>Quercus lobata</i>)	1,495.0	81.0	1,576.0
Interior Live Oak (<i>Quercus wislizeni</i>)	541.0	0.0	541.0
Canyon Live Oak (<i>Quercus chrysolepis</i>)	3,430.0	955.0	4,385.0
Black Oak (<i>Quercus kelloggii</i>)	61.0	0.0	61.0
Oracle Oak (<i>Quercus x morehus</i>)	74.0	0.0	74.0
Blue Oak (<i>Quercus douglasii</i>)	2,812.0	36.0	2,848.0
Inaccessible Oaks	831.0	1,053.0	1,884.0
Total (inches):	9,244.0	2,125.0	11,369

Table 2. Oak Resource Impacts			
Resource Type	Onsite Acres/Inches Impacted	Offsite Acres/Inches Impacted	Total Acres/Inches Impacted
Heritage Oak Trees			
Valley Oak (<i>Quercus lobata</i>)	719.0	0.0	719.0
Interior Live Oak (<i>Quercus wislizeni</i>)	488.0	0.0	488.0
Canyon Live Oak (<i>Quercus chrysolepis</i>)	2,966.5	935.0	3,901.5

*Quantity of replacement trees to be rounded up to the nearest whole number

3.0 TREE MITIGATION PLAN

3.1 Oak Woodland Mitigation

The Marble Valley Specific Plan has been designed to maximize oak woodland protection through a variety of methods. Not only does the Project limit the proposed development footprint to 693.1 acres of the 1,888 acres of oak woodland, further oak tree avoidance is anticipated through the incorporation of design measures intended to minimize land disturbance and retain additional oak woodland within the development footprint at the tentative map stage. As previously described, all future, individual development proposals within the Specific Plan area will be required to prepare a refined, land-specific oak resource technical report consistent with the County ORMP at the time of tentative map application. This seeming redundancy of analysis is intended to account for natural dynamics associated with oak woodlands such as ongoing tree growth and re-vegetation and natural mortality. Ultimately, this report will be used by both the County and applicants as a tool in evaluating oak resource impacts and possible mitigation methods at the time of future, individual tentative map proposals.

In total, 693.1 acres of existing oak woodlands (36.7% of all Project woodland) lay within the proposed development footprint (see Figure 4). As previously described, projects impacting less than 50% of total oak woodlands mitigate for impacts at a 1:1 ratio, per the requirements of the ORMP. Therefore, the Project will be required to replace impacted oak woodlands at a 1:1 ratio using the options mitigation described in Section 1.2.1 above. Consistent with California PRC 21083.4, replacement planting shall not account for more than 50 percent of the oak woodland mitigation requirement. Therefore, half of the Project's oak woodland impact mitigation requirement would consist of replacement planting onsite. Per the requirements of the ORMP, the replacement planting area must be suitable for tree planting, shall not conflict with current or planned land uses, and shall be large enough to accommodate replacement

plantings at a density equal to the density of oak woodlands impacted, up to a maximum density of 200 trees per acre. Replacement plantings are inspected, maintained and documented consistent with the requirements for mitigation maintenance, monitoring, and reporting per the ORMP.

The remaining Project's oak woodland impact mitigation requirement would be implemented in the form of an in-lieu fee payment to the County. The in-lieu fee for oak woodlands (\$8,285 / impacted acre of woodland) is based on the costs of acquisition of land and conservation easements, along with management, monitoring, and administrative costs. Because the proposed Project would mitigate up to 50% of the impacted 693.1 acres with replanting, under the current proposal the in-lieu fee for the remaining mitigation requirement would equate to \$2,871,581 for 346.6 acres of woodland impact (50 percent of 693.1 acres) at \$8,285 per acre.

3.2 Individual Oak Tree Mitigation

As previously described, up to a total of 11,369 inches of individual native oak trees could be impacted because of the Project. Additionally, 6,627.5 inches of individual Heritage Trees could be impacted. Options for individual native oak impact mitigation requirements include replacement plantings, in-lieu payment, or a combination of the two. Replacement plantings are required to be calculated based upon an inch-for-inch replacement of removed individual native oak trees, and a three-inch-for-one-inch replacement of removed Heritage Trees. This equates to the requirement of replanting 31,251.5 inches of oak trees, based on an inch-for-inch replacement standard for individual oak trees and an inch-for-inch replacement standard at a 3:1 ratio for Heritage Trees. Replacement trees are required to be monitored and maintained for a period of seven years, calculated from the day of planting. Replacement plantings must be inspected, maintained and documented consistent with requirements for mitigation maintenance, monitoring, and reporting per the ORMP. Currently, the in-lieu fee program requires a payment of \$153 per inch of impact for individual oak trees and \$459 per inch for Heritage Trees. Using the per-inch mitigation fee option would result in a fee of up to \$1,739,457 for individual oaks and \$3,042,022.50 for Heritage Trees. The total fee would be up to \$4,781,479.50.

3.3 Potential Oak Mitigation Assessment

The Village of Marble Valley Specific Plan Project will comply with the requirements of the ORMP through tree replanting and/or payment of fees. In terms of oak woodland impacts, the Project may mitigate up to 50% of the impacted 693.1 acres (includes both onsite and offsite impacts) of oak woodland with replanting. The remaining Project's oak woodland impact mitigation requirement would be implemented in the form of an in-lieu fee payment to the County in the amount of \$2,871,581 or off-site deed restriction or conservation easement acquisition and/or acquisition in fee title by a land conservation organization for purposes of off-site oak woodland conservation. Concerning oak individual impacts, the Project is required to mitigate for 31,251.5 inches of oak trees, based on an inch-for-inch replacement standard for individual oak trees and an inch-for-inch replacement standard at a 3:1 ratio for Heritage Trees. Impacts to oak tree individuals can be mitigated through replanting, payment of an in-lieu fee, or a combination of the two. Using the per-inch, in-lieu mitigation fee option would result in a fee of \$4,781,479.50.

However, all future, individual development proposals within the Specific Plan area will be required to prepare a refined, land-specific oak resource technical report consistent with the County ORMP at the time of tentative map application, and site-specific oak resource impacts and potential oak mitigation will be re-assessed and implemented at that time. Such site-specific analyses prepared at the time of specific development proposals are intended to account for natural dynamics associated with oak woodlands. Future oak resource technical reports will evaluate specific oak resource impacts and possible mitigation methods at the time of future, individual tentative map proposals.

A Biological Resources Study and Important Habitat Mitigation Plan for Oak Woodlands was completed for the Project in 2014 (see Attachment A). This Plan identifies standard mitigation measures that will be used by the Project to provide sufficient mitigation to impacts to oak trees. It contains an onsite mitigation assessment that details where oak trees can be planted (i.e., mitigation areas), mitigation measures to be used by the Project, and information on mitigation monitoring, success criteria, and reporting. As identified in the Biological Resources Study and Important Habitat Mitigation Plan for Oak Woodlands, the Project has incorporated various conservation, preservation, and oak replacement measures into its design to minimize impacts to oak trees and oak woodland habitat. For instance, ECORP has identified 135.2 acres within the Open Space areas as potential plantable space for oak mitigation (ECORP 2014). Within these 135.2 acres of plantable space, four classes of species and planting type were established, based on site suitability:

- Class 1 - blue/live oak acorns (± 50 acres);
- Class 2 - a combination of blue/live oak saplings and/or acorns (± 48 acres);
- Class 3 - black/live oak saplings (± 0.5 acres); and
- Class 4 - Valley/live oak saplings (± 37 acres).

Approximately 50.2 acres are suitable for blue/live oak acorns (Class 1). The majority of Class 1 locations are within the Open Space areas in the south-central portion of the Project area. In general, acorn plantings are ideal for rocky soils where digging is difficult. These areas contain large rock outcrops, steep slopes, and shallow, rocky soils. If supplemental irrigation is feasible, it is recommended to ensure survivorship of the acorns.

Oak saplings are suitable for soils with fewer, smaller rocks and where water is available for irrigation. In these areas, acorns can also be planted. Areas that are suitable for either saplings or acorns are classified as Class 2, and there are approximately 47.6 acres scattered around the site within this classification. Approximately 0.3 acre was identified as suitable for black/live oak saplings (Class 3), a small area in the northeast corner of the Project. Approximately 37 acres are suitable for valley/live oak saplings (Class 4). These areas are scattered within the Open Space areas within the central part of the Project area. Areas that are suitable for Class 4 saplings included low gradient areas and/or areas adjacent to creek channels where there tends to be deep soils with higher soil-water content.

Further detail concerning specific timing and phasing of plantings, maintenance of plantings, irrigation schedule, monitoring, and success criteria can be found in the Biological Resources Study and Important

Habitat Mitigation Plan for Oak Woodlands (Attachment A). Components of the Biological Resources Study and Important Habitat Mitigation Plan relating to mitigation maintenance, monitoring, and reporting will be modified to be consistent with the requirements of the ORMP.

The following is a summary of other measures proposed by the Project:

- In total, 1,284 acres of Open Space will provide regional protection of the biological resources through reducing habitat fragmentation by maintaining Open Space corridors, retaining animal dispersal corridors and migratory pathways, and preserving as much contiguous habitat as possible, consistent with the County's General Plan.
- The Project as designed does not contain and is not located directly adjacent to designated Important Biological Corridors or Ecological Preserve areas, and is not anticipated to have impacts on these areas.
- The Project has been designed and clustered to minimize impacts and reduce habitat fragmentation.
- To limit disturbance and impacts to biological resources, infrastructure elements such as bridges, roads, utilities, and pipelines will be placed within previously disturbed locations, where feasible.
- Oak woodland restoration or enhancement will be conducted to mitigate for losses to oak forest canopy and to enhance the ecological value of Open Space areas.
- Contiguous stands of oak woodland habitat and the corridors connecting the stands will be retained. In addition, the Project, as designed, preserves and provides access to the Bass Lake Road undercrossing, which has been identified as one of the few remaining wildlife corridors under US 50.
- The Project developer will prepare lot notebooks for each custom lot, which limit the development area for the placement and construction of primary and ancillary structures.
- To minimize impacts on custom lots, the Covenants, Conditions, and Restrictions (CC&R) Design Guidelines will set forth special design and construction measures to minimize impacts to oak trees, such as limiting excessive pad grading through the use of raised foundations, piers, post and beam construction and other similar measures, to the extent feasible.
- If necessary, pruning, cabling, and other corrective measures for preserved trees will be specified by an ISA-certified arborist, and will conform to the pruning standards of the ISA.
- Each tree or group of trees to be preserved within one foot of the drip line of ground disturbance will be protected with a fence or other acceptable methods, such as warning tape, indicating grading limits prior to any grading or movement of heavy equipment. Grading limit line demarcation should be removed following construction, and prior to installation of landscaping material.
- Signs will be posted on all sides of grading limit lines surrounding an individual tree or group of trees stating that each tree is to be preserved.

- Prior to construction, awareness training will be conducted for all construction personnel regarding the importance of the oak woodlands, the locations of preserved trees within the vicinity of the construction area, and preservation measures that are in place to protect them.
- To the extent possible no landscaping requiring permanent irrigation will be installed within the drip line of any preserved heritage or landmark tree, and to the extent possible, run-off, particularly from landscape irrigation, will be directed away from the root zone.
- Excavating and/or trenching within the drip line of trees (or a distance of half the drip line, outside of the drip line) will be avoided whenever practicable. However, if unavoidable, any authorized cut or fill occurring within the drip line of any preserved tree should be supervised by an ISA-Certified arborist.
- Any exposed roots will be covered with a protective material during construction.
- Native tree replacement will be used to mitigate the removal of native trees within the area, subject to approval by the County.
- Procedures and protocols for tree preservation and protection will comply with standards established by the County.
- Oak trees required to be planted as a condition of construction will be maintained after completion of construction according to this Plan.

4.0 CERTIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this Oak Resources Technical Report, and that the facts, statements, and information presented herein are true and correct to the best of my knowledge and belief.

1.0 INTRODUCTION

At the request of the Marble Valley Company, LLC, ECORP Consulting, Inc. (ECORP) conducted a Biological Resources Study and created an Important Habitat Mitigation Plan to address oak tree impacts and proposed mitigation for the Village of Marble Valley Specific Plan (VMVSP) Project. The 2,341-acre VMVSP is part of a proposed regional community plan for specific infill properties within the El Dorado Hills and Cameron Park communities and is located south of Highway 50, east of Bass Lake Road and west of Cambridge Road in El Dorado Hills within El Dorado County, California (Figure 1. *Project Location and Vicinity*).

1.1 Project Location

The Project is located within Township 9 North, Range 9 East, Section 17 and portions of sections 7-9, 16, 20-22, and 28 on the "Clarksville", "Shingle Springs", "Folsom S.E.", and "Latrobe, California" 7.5-minute topographic quadrangles (U.S. Department of the Interior, Geological Survey 1978a, 1973a, 1980, and 1973b, respectively). The Project is located at approximately 38° 39' 00" North and 121° 01' 15" West within the Upper Cosumnes watershed (USGS Hydrological Unit Code [HUC] #18040013) (U.S. Department of the Interior, Geological Survey 1978b).

The proposed Development includes 3,236 dwelling units of low, medium, and high density residential (1-24 dwelling units per acre) on approximately 797 acres, and approximately 475,000 square feet of retail and commercial uses, two schools, public and private parks, and 40-50 acres of vineyards. More than 50% of the site (approximately 1,284 acres) would be designated as either Community Open Space or Foundation Open Space, hereafter collectively referred to as Open Space, with an extensive network of trails interconnecting the proposed land uses (Figure 2. *Land Use Plan*).

1.2 El Dorado County Oak Woodland Mitigation Requirements

Forest and Oak Woodland Resources are protected by Objective 7.4.4 of the El Dorado County General Plan, which states:

Protect and conserve forest and woodland resources for their wildlife habitat, recreation, water production, domestic livestock grazing, production of sustainable flow or wood products, and aesthetic values. (El Dorado County 2009)

Policy 7.4.4.4 of the General Plan (El Dorado County 2009) specifies that for projects that are over one acre in size and have at least 1% canopy cover by woodland habitats, two mitigation options are available: Option A) the project applicant shall adhere to the tree canopy retention and replacement standards; or Option B) the project applicant shall contribute to El Dorado County's (County) Integrated Natural Resources Management Plan (INRMP) conservation fund. As this fund is not currently available, use of Option B is not feasible and the applicant for the VMVSP Project is required to follow Option A.

Option A specifies canopy retention standards based on the percentage of existing canopy within the Project. The retention rates, as stipulated in the *Interim Interpretive Guidelines for Policy 7.4.4.4 (Option A) (Guidelines)* (El Dorado County 2009), (Attachment A) are as follows:

<u>Percentage Existing Canopy Cover</u>	<u>Canopy Cover to be Retained</u>
80-100	60% of existing canopy
60-79	70% of existing canopy
40-59	80% of existing canopy
20-39	85% of existing canopy
10-19	90% of existing canopy
1-9 for parcels > 1 acre	90% of existing canopy

A summary of the mitigation requirements of Option A as it relates to the Project is provided below:

- 1) 80% of the existing oak woodland canopy cover shall be retained (See Section 2.2 for methods on how this retention rate was determined).
- 2) Impact to on-site oak woodland habitat shall be replaced at a 1:1 canopy ratio, where the oak replacement area shall equal at minimum the total area of the oak canopy cover proposed for removal.
- 3) Replacement of removed tree canopy shall be at a 200 trees/acre density or as recommended by a Qualified Professional so that the replacement trees will equal the canopy coverage removed within 10 to 15 years from the date of planting.
- 4) The County defines trees as one-gallon saplings or three locally-sourced acorns. Replacement trees must be either one-gallon, locally-sourced saplings or locally-collected acorns that have been stored properly.
- 5) Replacement trees must be managed so that ten years after planting, one-gallon saplings will measure an average of at least two-inch Diameter at Breast Height (DBH) with a 90% survival rate.
- 6) One-gallon saplings shall be maintained and monitored for 10 years, and acorn plantings shall be maintained and monitored for 15 years. A combination of saplings and acorns shall be maintained and monitored for 15 years.
- 7) Trees must have a 90% survival rate over the required monitoring period.
- 8) Any trees in excess of the acceptable 10% mortality that do not survive during the monitoring period shall be replaced by the property owner.
- 9) An initial Site Assessment Form and Tree Survey, Preservation, and Replacement Plan must be prepared by a Qualified Professional and submitted to the County's Planning Services Division. The intent of the Site Assessment is to determine if any of the following are impacted:
 - landmark or heritage trees;
 - oak corridor continuity;
 - sensitive or important oak woodland habitats;
 - oak woodland within or directly adjacent to important biological resources; and
 - oak canopy removal that exceeds allowable amount.

If the Site Assessment determines that none of the above is impacted and retention/replacement ratios are met, then a Biological Resources Study and Important Habitat Mitigation Plan (addressed below) may not be needed. If the Site Assessment shows that any of the above listed impacts are probable for a site (or at the County's discretion), impacts on woodland habitat and mitigation requirements shall be addressed in a Biological Resources Study and Important Habitat Mitigation Program that satisfies County requirements.

- 10) The *Biological Resources Study* is to be prepared by a Qualified Professional and is an evaluation of a Development that quantifies the amount of important habitat, by habitat type, and addresses the potential for the Development to adversely affect important habitat through conversion or fragmentation.
- 11) The *Important Habitat Mitigation Plan* is to be prepared by a Qualified Professional and should identify options that would avoid, minimize, or compensate for impacts on important habitats, including a monitoring and reporting component, and addresses "Certified Arborist Reports" and "Tree Protection Plans".
- 12) The Applicant shall enter into an agreement with the County for the long-term maintenance of the mitigation plantings.
- 13) Oak tree mitigation replacements must be completed prior to the Development's final grading or building inspection.

1.3 Purpose of This Study

Option A requires that the applicant prepares a Biological Resources Study and Important Habitat Mitigation Plan for the VMVSP, which will address oak woodland habitat impacts and mitigation. This document addresses both of these requirements.

The Biological Resources Study (Study) portion of this document was prepared by Debra Sykes [ECORP botanist and International Society of Arboriculture (ISA)-certified arborist (WE-8640A)] and does the following:

- documents the existing oak woodland and oak canopy habitat with the Project;
- presents proposed impacts to oak canopy with the current proposed land use plan;
- compares pre- and post-Development canopy cover;

- discusses the relative importance of the VMVSP oak woodland and oak canopy as habitat for regionally occurring wildlife species and as wildlife corridors; and
- discusses Project-related impacts on the remaining oak canopy.

The Important Habitat Mitigation Plan (Plan) portion of this document was prepared by Emily Tozzi [ECORP biologist and ISA-certified arborist (WE-10136A)] and addresses the following:

- How the VMVSP will conform to the requirements of Option A;
- Project avoidance, minimization, and/or compensation for impacts on important oak woodland habitats;
- Recommendations for tree protection during development; and
- Mitigation planting, monitoring, and reporting.

2.0 BIOLOGICAL RESOURCES STUDY

This Study identifies the existing oak woodland and oak canopy resources within the Project. Due to the quantity of oak trees within the Project, a traditional arborist survey (including tree inventory) was not conducted. Instead, a remote sensing-based canopy mapping approach was implemented. Oak woodlands were mapped as part of a vegetation community mapping exercise using aerial photographs and Light Detection and Ranging (lidar) data and total oak canopy was mapped using hyperspectral imaging and lidar technology.

2.1 Oak Woodland Habitat Resources

2.1.1 Vegetation Communities

2.1.1.1 Vegetation Communities Mapping Methods

Vegetation communities were digitized using a WACOM Cintiq 21UX DTZ-2100D LCD Pen Tablet and ArcView 10.1 onto a high-resolution 0.5-foot pixel, 1"=100' aerial photograph flown in April 2008 (Merrick and Company 2008). Additionally, lidar data were used to distinguish height classes of vegetation. This technique was used to delineate the white leaf manzanita chaparral

community. Plots of greater than 25 square feet where vegetation height was between two feet and nine feet tall were identified as the white leaf manzanita chaparral and polygons were digitized around these areas.

Additionally, lidar was used to calculate the density of canopy cover within each polygon. The vegetation community classification was based on the classification systems presented in *A Manual of California Vegetation* (Sawyer *et al.* 2009), *Preliminary Descriptions of the Terrestrial Natural Communities of California* (Holland 1986), and *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer Jr. 1988).

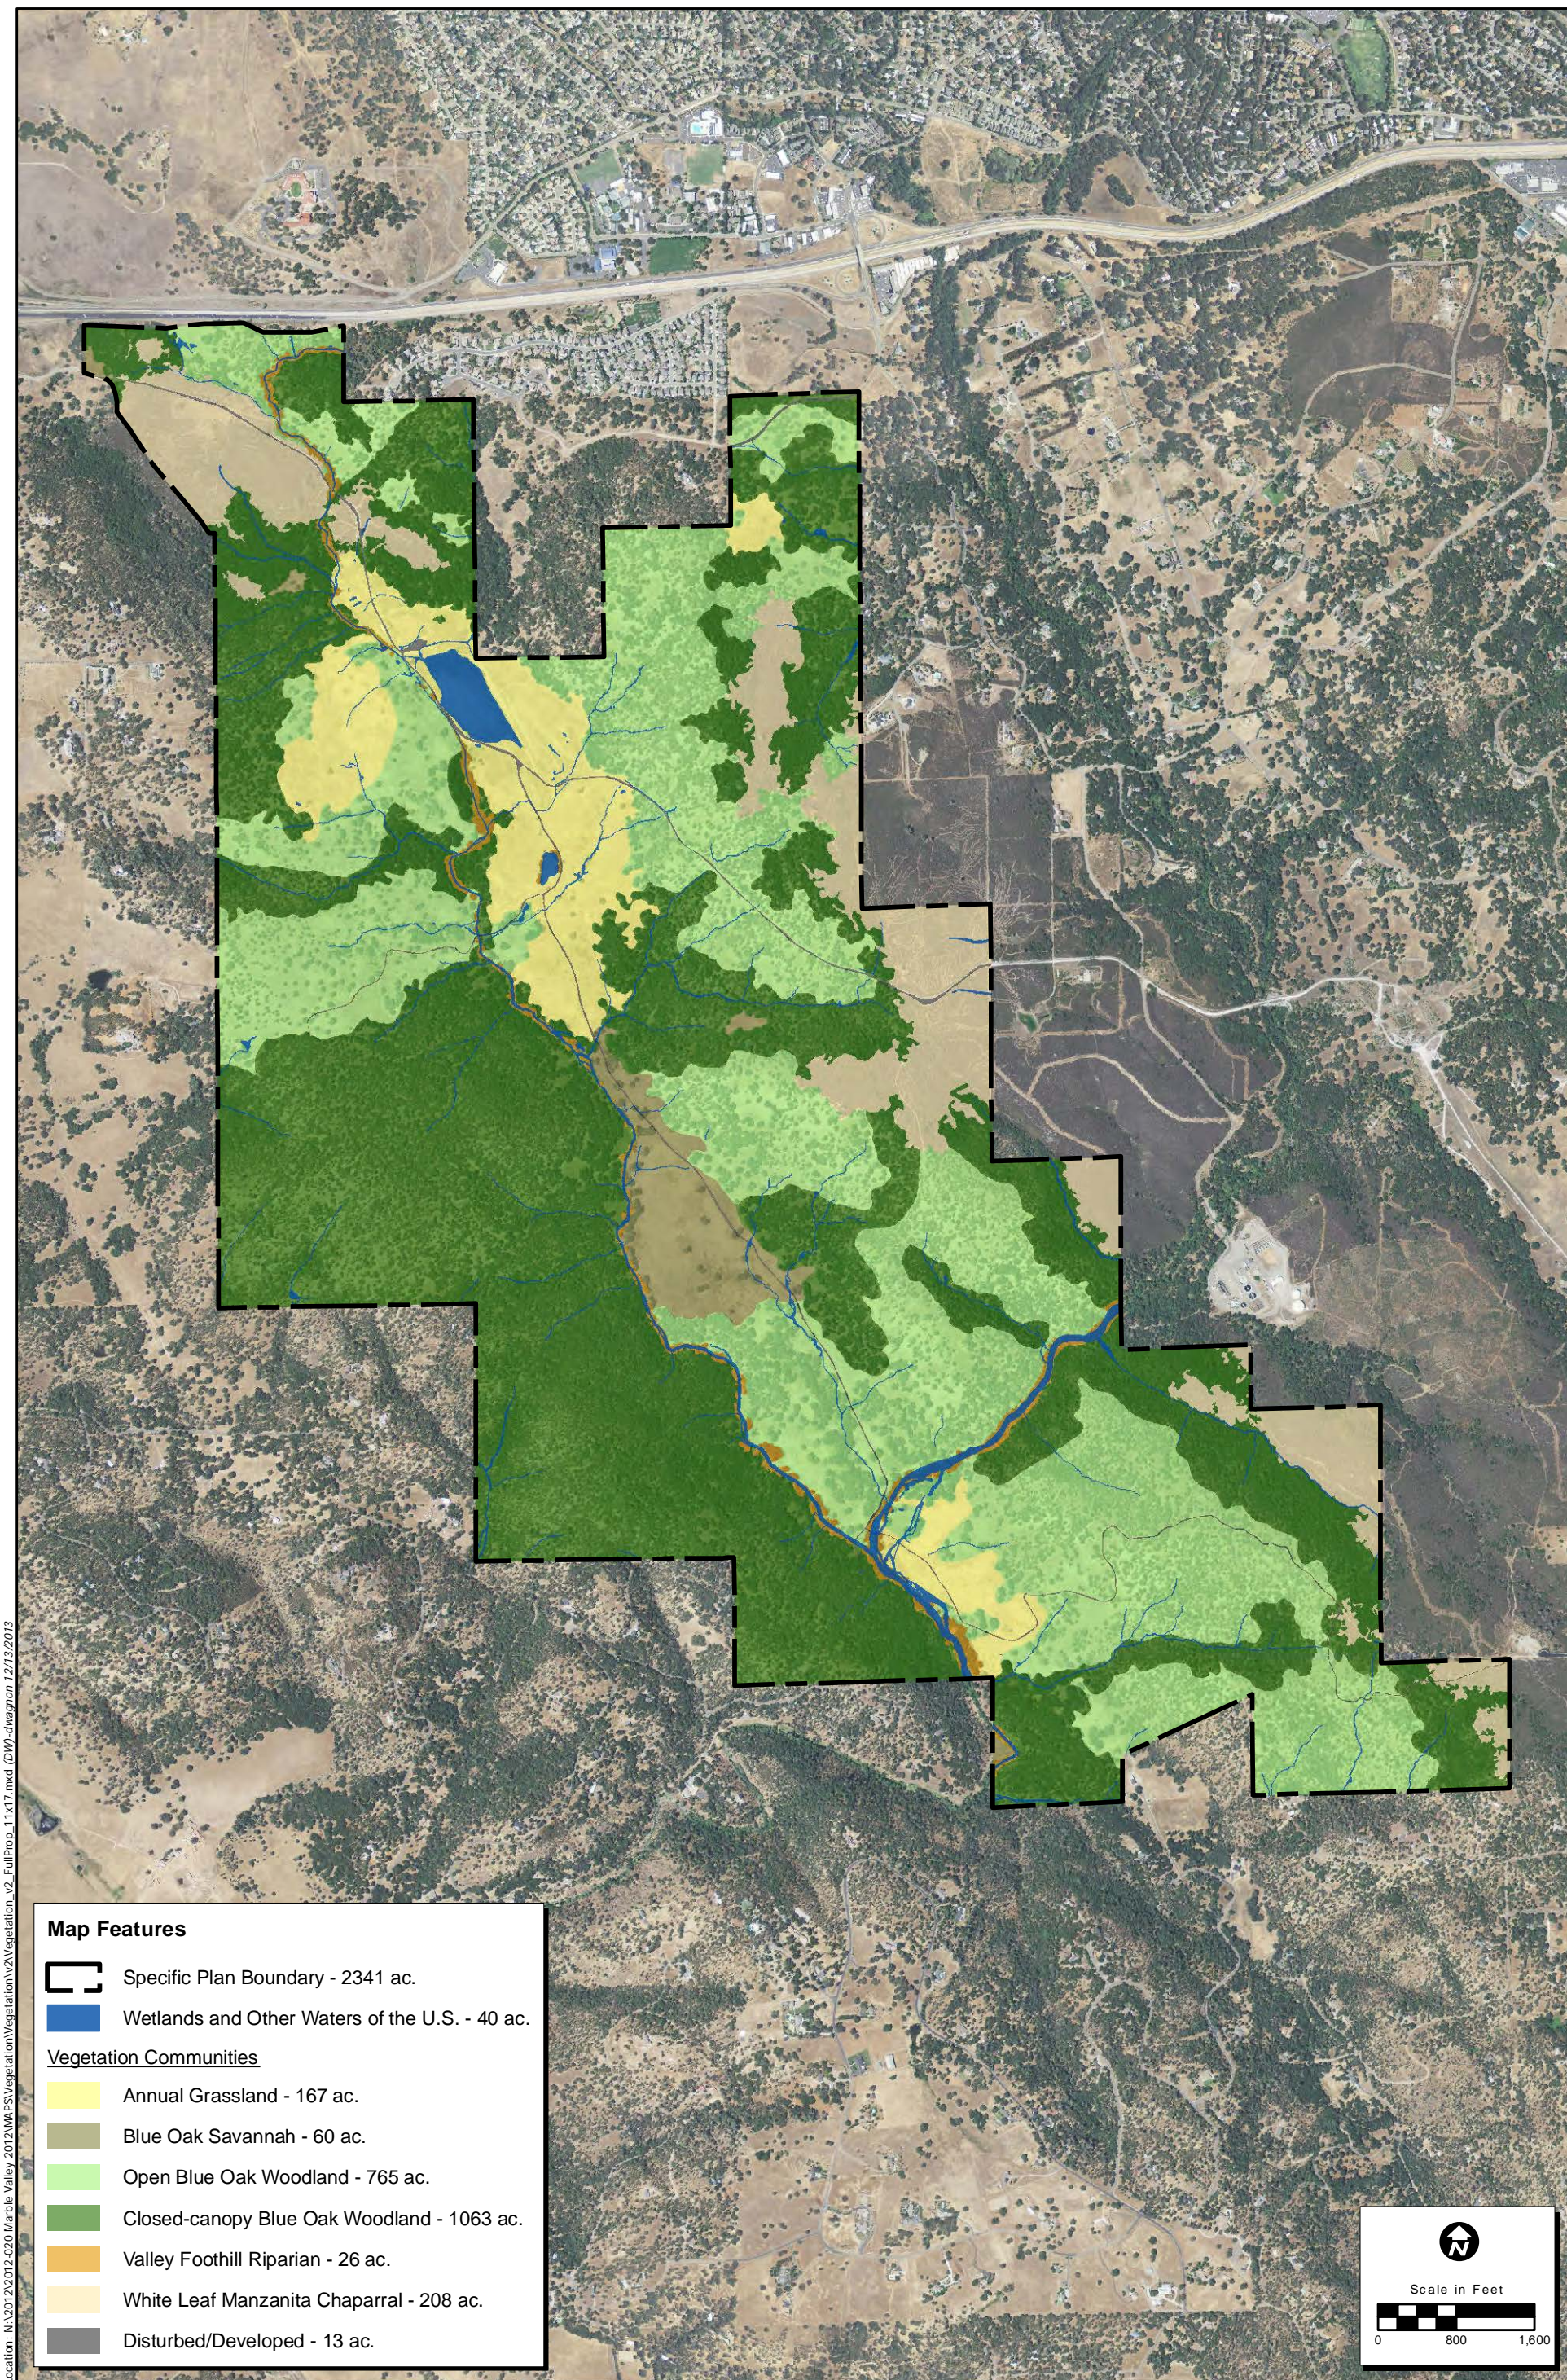

2.1.1.2 Vegetation Communities Mapping Results

A total of seven vegetation communities were mapped within the VMVSP area (Figure 3. *Vegetation Communities*). Included within these vegetation communities are three communities that are dominated by oak trees: blue oak savannah (60 acres), open blue oak woodland (765 acres), and closed-canopy blue oak woodland (1,063 acres). These communities were delineated based on the following parameters:

- Blue Oak Savannah: 2 to 10% canopy coverage
- Open Blue Oak Woodland: 11 to 60% canopy coverage
- Closed-Canopy Blue Oak Woodland: >60% canopy coverage

In addition to these oak-dominated communities, occasional individual oak trees are also found within the other vegetation communities on-site.

The following sections provide a brief description of the of the three oak-dominated vegetation communities.

Figure 3. Vegetation Communities
2012-020 The Village of Marble Valley Specific Plan

Blue Oak Savannah

Blue oak savannah was mapped where oak canopy cover is between 2% and 10%. This vegetation community supports primarily annual grassland vegetation with scattered blue oaks (*Quercus douglasii*) and Valley oaks (*Quercus lobata*). The annual grasslands are comprised primarily of non-native grasses and forbs, including false brome (*Branchypodium distachyon*), soft brome (*Bromus hordeaceus*), ripgut brome (*Bromus diandrus*), slender wild oats (*Avena barbata*), Italian ryegrass (*Festuca perennis*), red stem filaree (*Erodium botrys*), hedgehog dog-tail grass (*Cynosurus echinatus*), and clovers (*Trifolium* species). Other species commonly observed in this community include bull thistle (*Cirsium vulgare*), yellow star-thistle (*Centaurea solstitialis*), brodiaeas (*Brodiaea* species), clarkias (*Clarkia* species), sticky tarweed (*Holocarpha virgata*), and medusahead grass (*Elymus caput-medusae*).

Open and Closed-Canopy Blue Oak Woodlands

Blue oak woodlands are the most extensive vegetation community within the Project. Two types of blue oak woodlands were mapped on-site: Open Blue Oak Woodland, which has 11% to 60% oak canopy cover, and Closed-Canopy Blue Oak Woodland, which has greater than 60% oak canopy cover.

Both of these woodlands support similar plant species. The canopy of both of these blue oak woodlands is almost exclusively comprised of blue oak; however, Interior live oak (*Quercus wislizenii*), Valley oak, black oak (*Quercus kelloggii*), California buckeye (*Aesculus californica*), and gray pine (*Pinus sabiniana*) occasionally occur. Common understory shrubs within the blue oak woodlands include toyon (*Heteromeles arbutifolia*) and poison-oak (*Toxicodendron diversilobum*). The herbaceous understory of the blue oak woodland is primarily dominated by non-native, naturalized grasses, including hedgehog dog-tail grass, ripgut brome, soft brome, false brome, goat grass (*Aegilops triuncialis*), and slender wild oat. Other common species in the understory of the blue oak woodlands include spring vetch (*Vicia sativa*), rose clover (*Trifolium hirtum*), twining brodiaea (*Dichelostemma volubile*), and hedge parsley (*Torilis arvensis*).

2.1.2 Oak Canopy

2.1.2.1 Oak Canopy Mapping Methods

Oak canopy was mapped using both hyperspectral imaging and lidar technology in ArcGIS Advanced with the Spatial Analyst Extension. These techniques mapped the location and canopy area of native oak trees and other vegetation types on the Project. As part of this process, a 155-band hyperspectral imager was utilized to identify the spectral signatures of specific vegetation types and the lidar sensor recorded the precise location and size of different clusters of vegetation. Vegetation greater than five feet tall was considered to be tree canopy.

Once tree canopy areas were identified, a supervised classification was used to establish canopy type. Potential canopy types included oak, riparian, chaparral, and other vegetation. The imagery-based canopy model was then supplemented by the use of tree canopy heights established by lidar to help determine oak tree locations in mixed canopy areas. Results were groundtruthed by ECORP botanists and arborists.

Generally, single type vegetation clusters (e.g., oak or chaparral) were correctly identified. Mixed species clusters, primarily riparian area with some oak trees, were more difficult to classify. These areas were checked against high resolution orthophotos and oak tree canopy was identified and separated from other vegetation. Finally, oak canopy was extracted from the vegetation data, field verified, and quantified.

2.1.2.2 Oak Canopy Mapping Results

Across the entire 2,341-acre VMVSP, a total of 1,137.8 acres of oak canopy cover was mapped (Figure 4. *Oak Tree Canopy*). Oak canopy accounts for 49% of the total cover for the entire Project area.

Location: N:\2012\2012-020 Marble Valley 2012\MapPS\S\S_Survey_and_Mapping\Oak_Canopy\Canopy_b.mxd (DW) dwagmon 11/25/2013

Map Date: 11/25/2013

Figure 4. Oak Tree Canopy

2.2 Impact Analysis

2.2.1 Oak Canopy Impacts

A total of 1,137.8 acres of oak canopy occurs within the VMVSP Project. This accounts for 49% of the total vegetative cover for the entire Project. Therefore, based on the canopy retention rates stipulated in the Guidelines (El Dorado County 2009) and summarized in Section 1.2 of this document, the Project is required to avoid 80% and allowed to impact 20% (227.6 acres) of oak canopy.

The current preferred development footprint is only a portion of the Project area. Of the 1,137.8 acres of oak canopy within the entire VMVSP project, 371.4 acres of oak canopy occurs within the development footprint (Figure 5. *Oak Canopy Impact Areas*). As the project is allowed 227.6 acres of impacts, avoidance measures have been incorporated into the various project design elements in order to meet the 20% impact threshold. Depending on the project element within the footprint (e.g., road, residential lot, park), it is estimated that a certain percentage of oak canopy will be retained. The following list shows examples of project elements and the target oak canopy retention rates determined for that element:

<u>Target Oak Retention Rate</u>	<u>Example Project Elements</u>
100%	Open Space, Detention Areas
75%	Residential (Custom Lots), Park
40%	Minor Roads, Crossings
20%	Office Park
17%	Residential (Pad Graded)
15%	School
10%	Park (Joint Use With School)
0%	Major Roads, Commercial

Based on the proposed project elements, Table 1 summarizes the total oak canopy acreage, target retention rate, and impact acreage for different project element types based on the proposed retention rates, and (Figure 6. *Oak Canopy Retention*) illustrates the locations of these retention rates within the Project design. Actual retention rates may vary for each of the proposed project elements as development of the Specific Plan progresses, but shall not exceed the maximum impact acreage allowed under Option A (227.6 acres).

Agricultural Exemption Area	EXEMPT	9.1	N/A
TOTAL		1,137.8	227.2*

**Values are calculated in square feet, and then converted to acres. Rounding errors may occur.*

After incorporating these retention rates to the oak canopy impact acreages, total project related impacts to oak canopy are 227.2 acres which complies with the canopy retention rates stipulated in the Guidelines. Table 2 compares pre- and post-Project oak canopy cover within the Project area.

Project Phase	Oak Canopy (acres)
Pre-Project	1,137.8
Post-Project	910.6*

** This total does not include mitigation plantings discussed in Section 3.0 below*

2.3 Oak Woodland Corridors

2.3.1 Importance of Oak Woodland and Corridors

Oak woodland habitats are one of the most ecologically diverse communities within California, and oak trees provide a number of ecological services within the landscape including, but not limited to, shade, shelter, erosion protection, and food (McCreary 2011) for birds, mammals, reptiles, and amphibians. Acorns, leaves, sap, and wood provide food while the trees themselves provide microhabitats, shelters, and living places for wildlife species (McCreary 2011). Larger mammals such as deer, bears and mountain lions depend on larger, intact landscapes in order to thrive.

Urbanization and development within the oak woodland communities of California has caused fragmentation of existing oak woodlands. As woodlands become fragmented into smaller and smaller pieces, the essential landscape linkages for larger wildlife species become rarer, and the quality and health of the oak woodlands diminishes over time. Appropriately designed developments that retain the majority of oak canopy can continue to provide corridors and linkages between larger intact woodlands.

2.3.2 Impacts to Oak Woodland and Corridors within the Villages of Marble Valley Specific Plan

As conceptually designed, the VMVSP Project will impact 227.2 acres of oak canopy within the Project area, but may impact 227.6 acres as allowed by Option A. This represents 20% of the total oak canopy within the Project area, and complies with Option A of General Plan policy 7.4.4.4. The majority of the development is occurring within the northern two-thirds of the site, and the project has been designed to avoid large tracts of unfragmented oak woodland and preserve wildlife corridors. These areas will remain undeveloped to protect the habitat for many wildlife species. Nearly the entire edge of the Development footprint will not be disturbed and will provide approximately 300 to 500 feet of oak woodland buffer and wildlife corridors around the edge of the development footprint. The 300- to 500-foot buffer also acts as a transition to the neighboring 5-acre residential estates that surround the Marble Valley project site and support additional wildlife movement. In addition, the custom residential lots in the southwestern and northeastern corners of the site will retain 75% or more of the oak canopy within this area. It is expected that woodland animals would still use these parcels as corridors for migration. The entire south-eastern portion of the Project Area is designated as Open Space and provides a highly suitable corridor for wildlife species between the east and west sides of the Project and to the woodlands adjacent to the Project to the south.

A Wildlife Corridor study was conducted by Sierra Ecosystems Associates (2010) for El Dorado County which identified the importance of north-south wildlife corridors throughout the County. In addition, the report identified the Bass Lake Road undercrossing as one of the few remaining wildlife crossings to the north of Highway 50. With more than half of the Project conserved as open space and development areas clustered to minimize impacts to oak woodlands, large expanses of habitat remain for the protection of species. The design of the land plan includes

the riparian corridors of Deer Creek and Marble Creek to allow for the continued movement of species. Moreover, the entire western edge of the Plan Area provides a 300- to 500-foot north-south open space buffer that is restricted from development so that wildlife connectivity to the Bass Lake Road undercrossing remains uninterrupted (Figure 7. *Wildlife Corridors*).

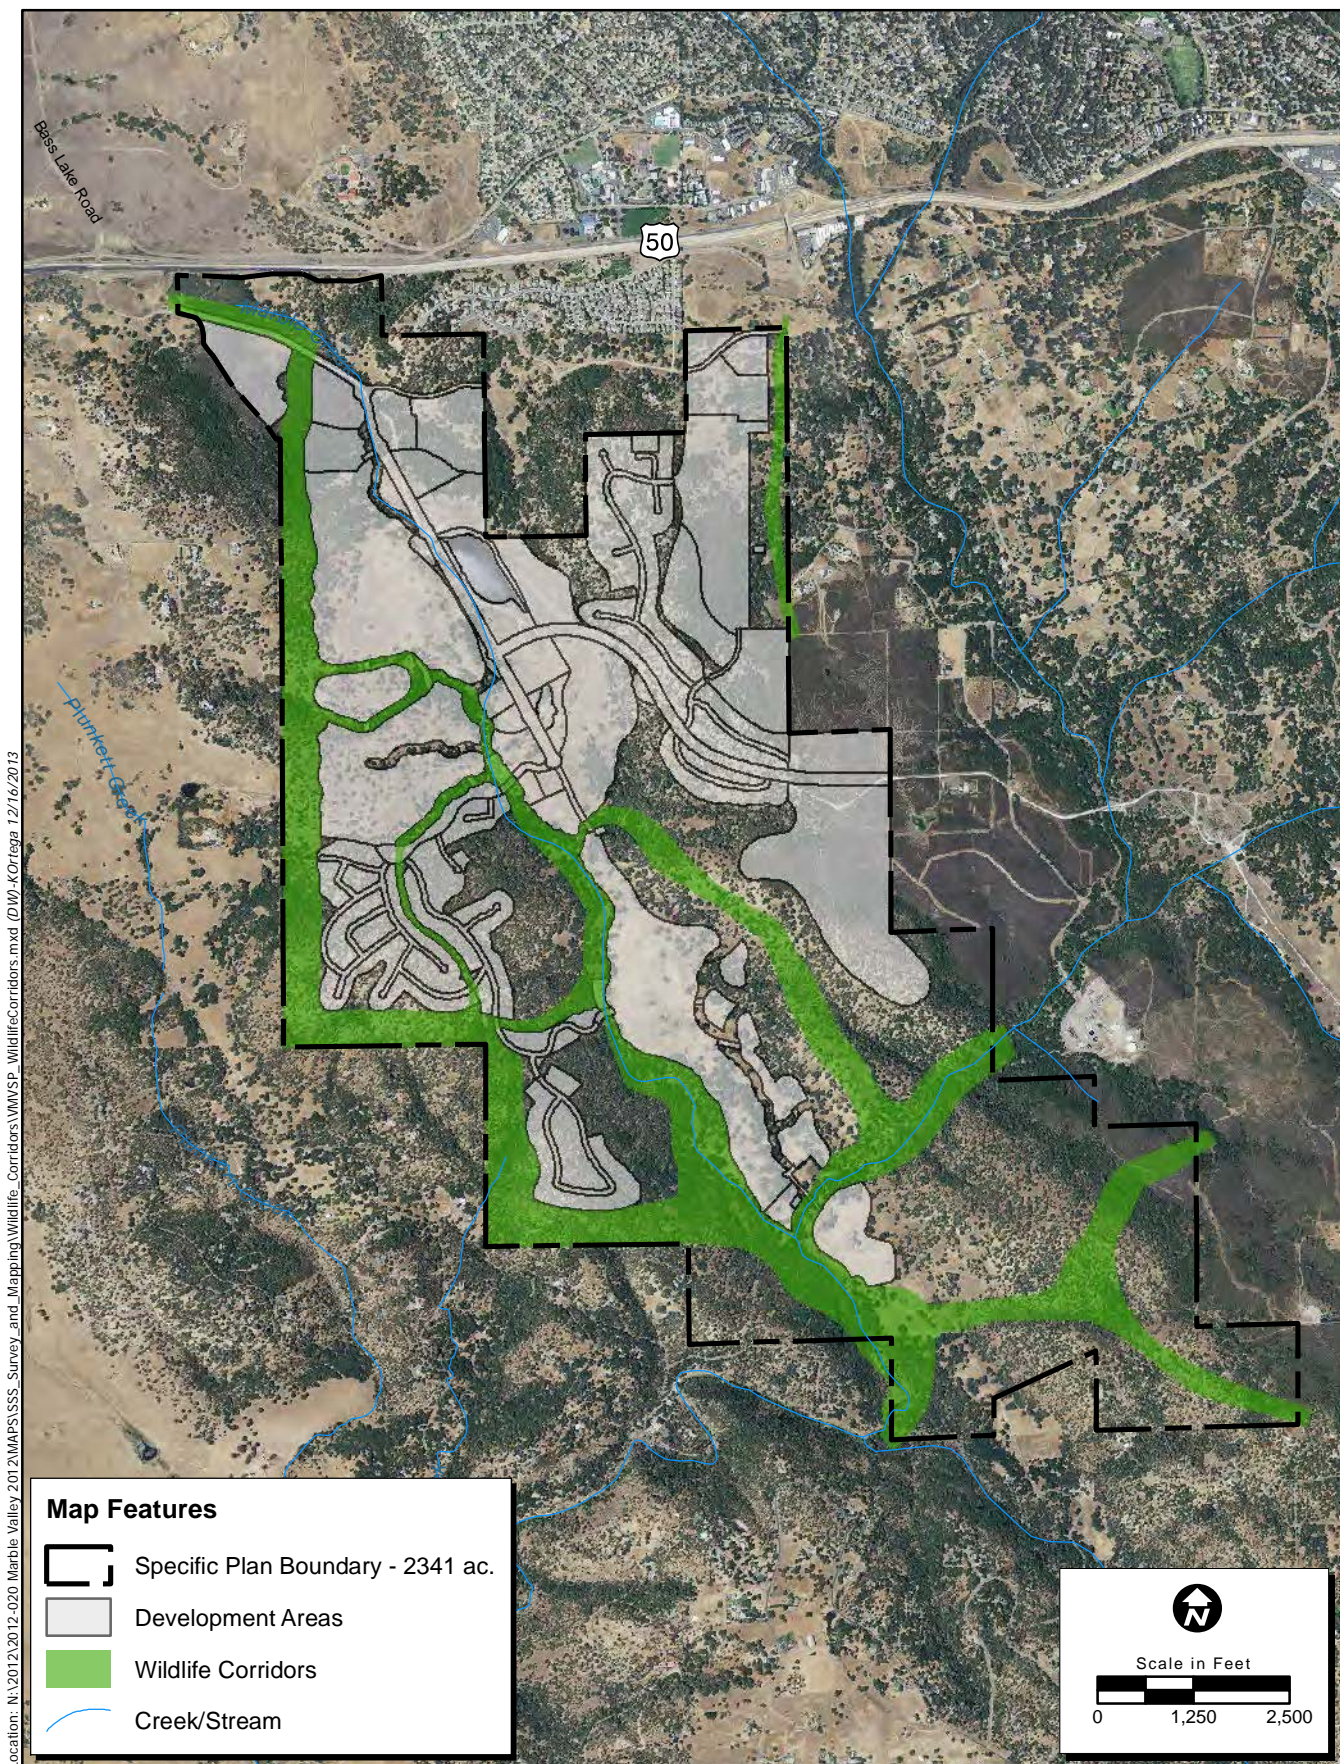

2.3.3 *Post-Construction Oak Woodlands*

Given the large intact oak woodlands that will be present after construction of the Project and the connectedness of the patches of woodland, no long-term effects to either the oak trees or the plants and wildlife that live within the woodlands are expected.

As part of the mitigation for the Project, oak tree plantings and acorn plantings will occur within designated oak replacement areas within the Open Space areas, within temporarily graded areas along roads, and within public spaces and residential areas. Additional oak plantings will occur to enhance the already existing oak woodland by incorporating this habitat type into the development. These trees will add to the overall quantity of oak canopy and further provide habitat for wildlife species (see Section 3.0 for more details regarding mitigation plantings).

2.4 **Conclusions**

The VMVSP has been designed to maximize oak woodland protection through a variety of methods. It has an extensive open space network that occurs in more than 50% of the plan area. It incorporates minimization measures to retain most of the oak canopy within the development footprint and avoids the disruption of large, intact open space areas. In total, the Project is impacting 20% of the existing oak canopy, and leaving intact large swaths of mature oak woodlands. These woodlands also have the highest density of oak trees within the Project area. The Project design allows for contiguous oak woodland habitat, including several large, intact woodlands to support wildlife. The large, intact woodlands provide suitable habitat for large mammals that require larger tracts of undisturbed land.

Photo Source: NAIP (2012)

Figure 7. Wildlife Corridors

2012-020 The Village of Marble Valley Specific Plan

In addition to the avoidance and retention measures, the Project plans to mitigate for oak canopy loss by planting new oak trees and acorns within on-site oak replacement areas, temporarily impacted areas (i.e., graded slopes), off-site planting areas and select locations within the development parcels. These mitigation measures are discussed in more detail in Section 3.0. The proposed oak mitigation will provide additional habitat, especially for birds that may use these trees as nesting and/or foraging habitats or as corridors to more intact woodlands. Overall, the VMVSP Project will continue to provide high quality oak woodlands to support regionally occurring wildlife species.

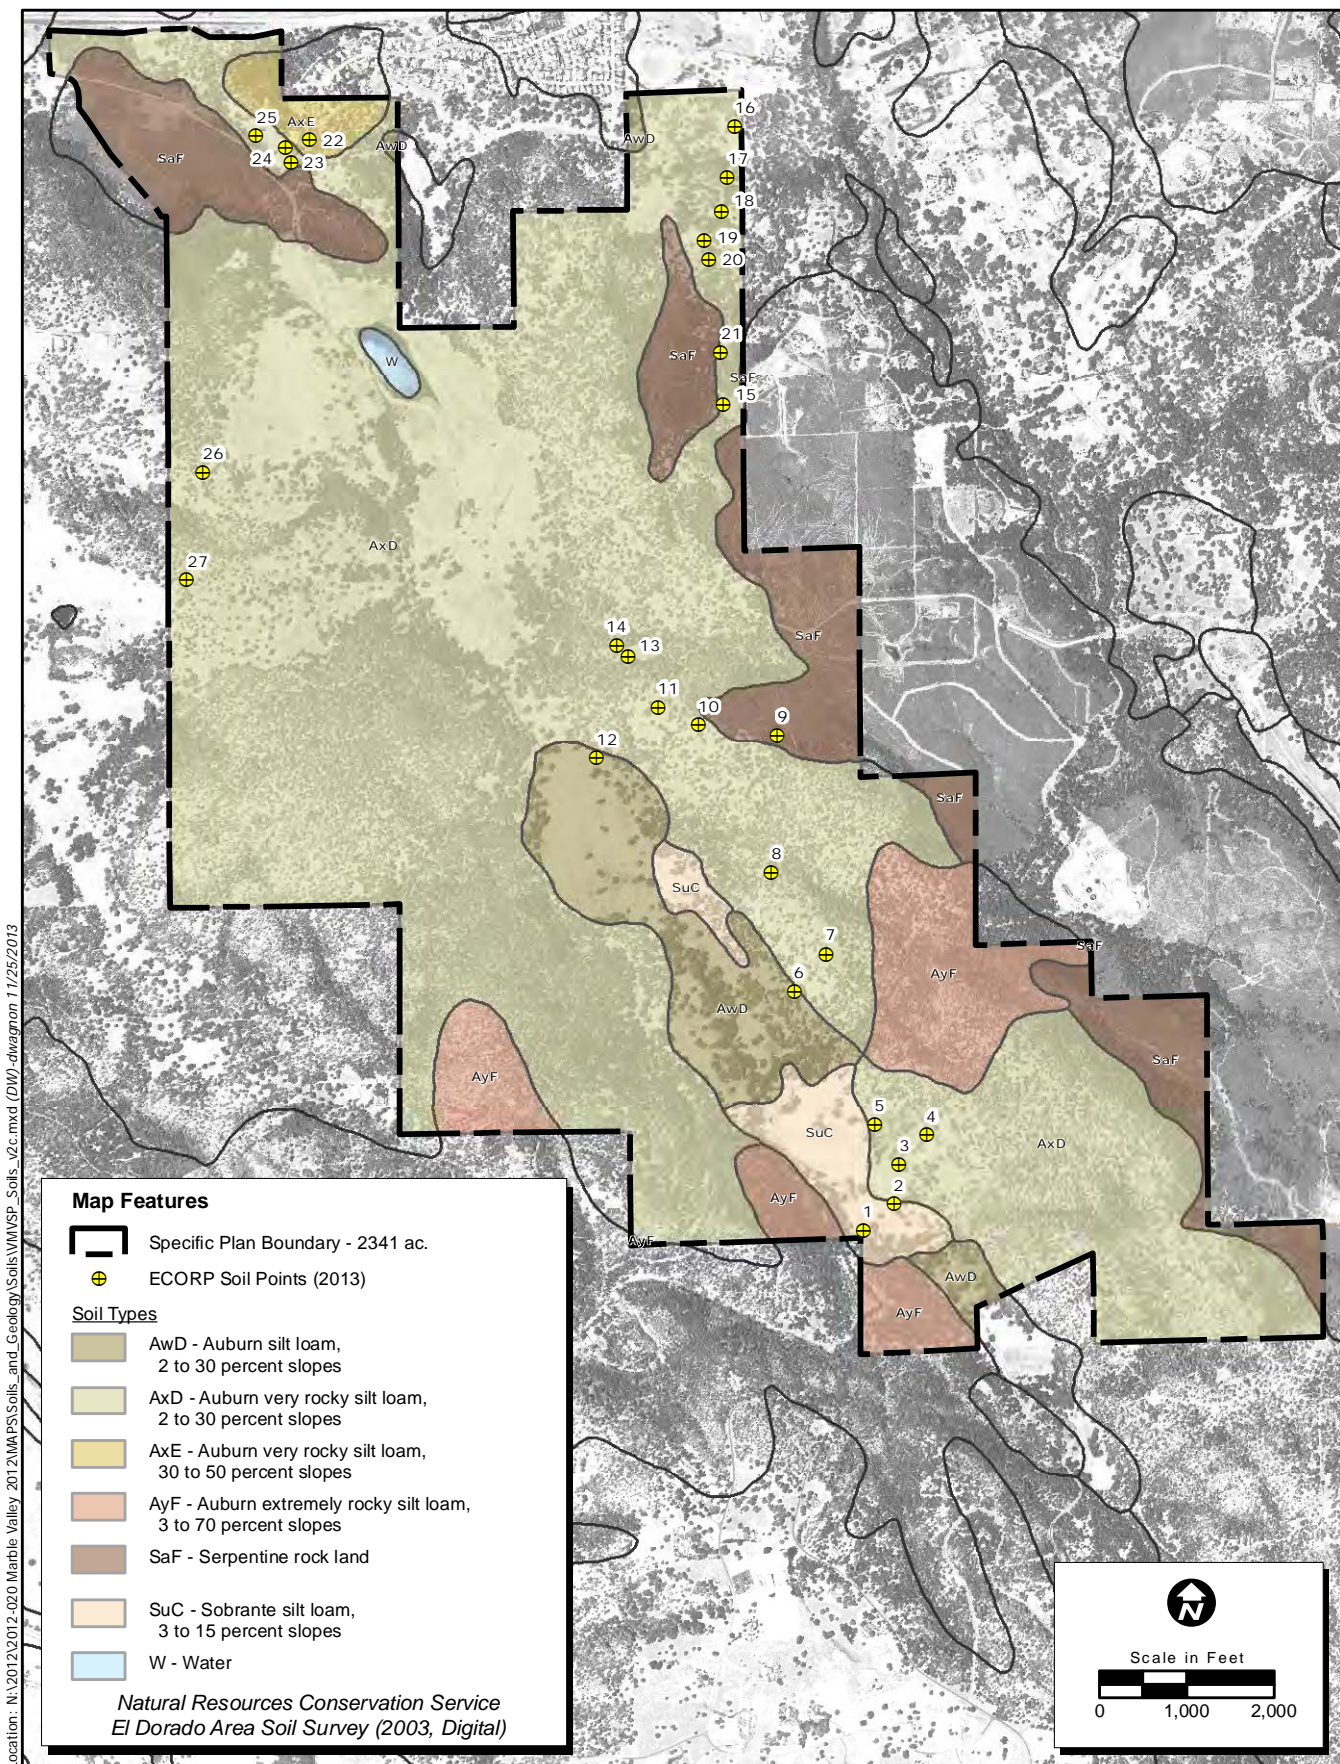

3.0 IMPORTANT HABITAT MITIGATION PLAN

This Plan identifies the mitigation measures that will be used by the Project to provide sufficient protection to oak tree resources. It contains an on-site and off-site mitigation assessment that details where oak trees can be planted within mitigation areas, mitigation measures to be used by the Project, and information on mitigation monitoring success criteria and reporting.

3.1 Potential On-Site Oak Mitigation Assessment

An oak mitigation assessment was conducted to establish the potential for on-site oak planting within the Project area. Prior to conducting field surveys, aerial photos of the 2,341-acre VMVSP area overlain with the current land use plan (Figure 2) and Natural Resources Conservation Service (NRCS) soil map units (Figure 8. *Natural Resources Conservation Service Soil Types*) were reviewed by Tara Collins (ECORP Senior Botanist) and Emily Tozzi (ECORP biologist and ISA-certified arborist). Open Space areas within the VMVSP area that appeared to have appropriate soils and lacked dense canopy cover were identified as potential oak mitigation areas.

On 29 January and 1 February 2013, Ms. Collins and Ms. Tozzi conducted field surveys in 27 previously-identified potential oak mitigation areas to determine oak mitigation suitability. These 27 locations represented a subsample of areas identified as potential oak mitigation sites. At each location, soils were analyzed to validate soil data on NRCS soil maps and soil series descriptions (Figure 8. and Attachment B).

Location: N:\2012\2012-020 Marble Valley 2012\MAPS\Soils_and_Geology\Soils\VMVSP_Soils_v2c.mxd (DW) dwagon 11/25/2013

Map Date: 11/25/2013
Photo Source: NAIP (2012)

Figure 8. Natural Resources Conservation Service Soil Types

In addition photos facing the four cardinal directions were taken. Each location was mapped using a GPS unit with sub-meter accuracy. Within each of the potential areas, the following data were collected:

- Existing vegetation and canopy cover
- Slope and aspect
- Soil data including texture, color, and horizonization
- Potential for irrigation from the Development

These data were used to determine site-specific potential for oak tree mitigation. For each site, the appropriate oak tree species and planting type (i.e., acorn, sapling) were determined based on the following:

- 1) West facing slopes with shallow, rocky soils will be the most difficult for successful oak mitigation establishment, especially if irrigation is not possible.
- 2) Many hillslope summits and shoulderslopes will not be suitable for oak mitigation because of the high concentration of large rock outcrops.
- 3) Areas with very rocky, steep hillsides and/or shallow soils are only appropriate for acorn plantings.
- 4) Valley oaks (*Quercus lobata*) are more suited for deeper floodplain soils with higher clay contents.
- 5) Blue oaks (*Quercus douglasii*) are well suited for shallow, rocky soils found on hillsides and summits.
- 6) Interior live oaks (*Quercus wislizenii*) are suitable for floodplains and rockier hillsides as this species tends to establish in areas with Valley and blue oaks.
- 7) Areas with existing dense canopy are not considered appropriate for oak mitigation.

After an analysis of the available data (e.g., soil maps and descriptions, existing conditions), a suitability determination was made for each of the previously identified potential oak mitigation areas. All suitable areas were mapped using ArcGIS software and acreages were calculated. Approximately 184.4 acres were identified as suitable oak mitigation areas within the VMVSP. Planting areas are discussed in more detail in Section 3.3.1.

3.2 Mitigation Measures

3.2.1 Conservation Measures

The Project has incorporated various conservation measures into its design to minimize impacts to oak woodland habitat. The following is a summary of these measures:

- Overall, up to 20% (227.6 acres) of oak woodland canopy will be impacted during Project development.
- In total, 1,284 acres of Open Space will provide regional protection of the biological resources through reducing habitat fragmentation by maintaining Open Space corridors, retaining animal dispersal corridors and migratory pathways, and preserving as much contiguous habitat as possible, consistent with the County's General Plan.
- The Project as designed does not contain and is not located directly adjacent to designated Important Biological Corridors or Ecological Preserve areas, and is not anticipated to have impacts on the aforementioned areas.
- The Project has been designed and clustered to minimize impacts and reduce habitat fragmentation.
- As required by regulatory agencies, Project activities will be planned to avoid critical time periods (i.e., nesting and breeding) for fish, birds, and other wildlife species. If construction must occur during a critical time period, then the appropriate biological surveys will be conducted. If it is determined that Project activities could have negative impacts on a species, then the appropriate agencies will be consulted and protective measures will be employed to mitigate the impacts.
- To limit disturbance and impacts to biological resources, infrastructure elements such as bridges, roads, utilities, and pipelines will be placed within previously disturbed locations, where feasible.
- Oak woodland restoration or enhancement will be conducted to mitigate for losses to oak forest canopy and to enhance the ecological value of Open Space areas.
- Contiguous stands of oak woodland habitat and the corridors connecting the stands will be retained (see Figure 7). In addition, the Project, as designed, preserves and provides access to the Bass Lake Road undercrossing, which has been identified as one of the few remaining wildlife corridors under Highway 50.

- A Stormwater Pollution Presentation Plan (SWPPP) will be prepared prior to ground-breaking activities to determine the most appropriate Best Management Practices (BMPs) for reducing impacts from construction activities.
- The project developer will prepare lot notebooks for each custom lot, which limit the development area for the placement and construction of primary and ancillary structures.
- To minimize impacts on custom lots, the Covenants, Conditions, and Restrictions (CC&R) Design Guidelines will set forth special design and construction measures to minimize impacts to oak trees, such as limiting excessive pad grading through the use of raised foundations, piers, post and beam construction and other similar measures, to the maximum extent feasible.
- In addition to the County's site plan review and approval procedures, the Architectural Control Committee of the Master Owners' Association will review and approve site and improvement plans for custom lots prior to ground-disturbing activities.

3.2.2 Tree Preservation Measures

Construction, planting and irrigation contractors will be made aware of existing trees and shrubs to be preserved and will take precautions to protect such vegetation from damage. Whenever possible, irrigation lines will avoid the drip line of existing trees and shrubs. Equipment, construction materials, fuels, and tools will not be stored within the drip line of the trees or shrubs to be preserved.

The following measures will be implemented to protect and minimize effects to preserved trees that are adjacent to construction activities.

- If necessary, pruning, cabling, and other corrective measures for preserved trees will be specified by an ISA-Certified arborist, and will conform to pruning standards of the ISA.
- Each tree or group of trees to be preserved within one foot of the drip line of ground disturbance will be protected with a fence or other acceptable methods, such as warning tape, indicating grading limits prior to any grading or movement of

heavy equipment. Grading limit line demarcation should be removed following construction, and prior to installation of landscaping material.

- Signs will be posted on all sides of grading limit lines surrounding an individual tree or group of trees stating that each tree is to be preserved.
- Prior to construction, awareness training will be conducted for all construction personnel regarding the importance of the oak woodlands, the locations of preserved trees within the vicinity of the construction area and preservation measures that are in place to protect them.
- To the extent possible no landscaping requiring permanent irrigation will be installed within the drip line of any preserved heritage or landmark tree, and to the extent possible, run-off, particularly from landscape irrigation, will be directed away from the root zone.
- Excavating and/or trenching within the drip line of trees (or a distance of half the drip line, outside of the drip line) will be avoided whenever practicable. However, if unavoidable, any authorized cut or fill occurring within the drip line of any preserved tree should be supervised by an ISA-Certified arborist.
- Any and all exposed roots will be covered with a protective material during construction.
- Native tree replacement will be used to mitigate the removal of native trees within the area, subject to approval by the County.
- Procedures and protocols for tree preservation and protection will comply with standards established by the County.
- Oak trees required to be planted as a condition of construction will be maintained after completion of construction according to this Plan.

3.3 Proposed Revegetation and Restoration Plan

3.3.1 Required Oak Replacement

Option A requires that the oak replacement area shall equal, at a minimum, the total area of the oak canopy cover proposed for removal. As conceptually designed, a total of 227.2 acres (and potentially up to 227.6 acres) within the Project are proposed for impact. Therefore,

Option A requires that 227.2 acres (and potentially up to 227.6 acres) are planted as oak replacement. ECORP identified 184.4 acres within the Open Space areas as potential oak mitigation within the Open Space areas. However, with the existing oak canopy, only 135.2 acres are considered plantable space. To comply with the replacement requirements specified in Option A, additional mitigation is proposed for the remaining 92 acres of replacement canopy. This includes additional on-site planting within temporarily impacted areas (i.e., graded slopes) and off-site plantings. If additional mitigation is needed for the additional 0.4 acre of potential impacts allowed under Option A, than new planting areas will be identified.

In addition to the mitigation required under Option A, the applicant proposes to do additional oak tree replacement and plantings within certain land use types (e.g., custom residential lots, low and medium residential lots). These plantings will be a requirement of the proposed Design Guidelines to be developed and adopted for each use and enforced through the Project's CC&R's. All four of these mitigation types are discussed in more detail below.

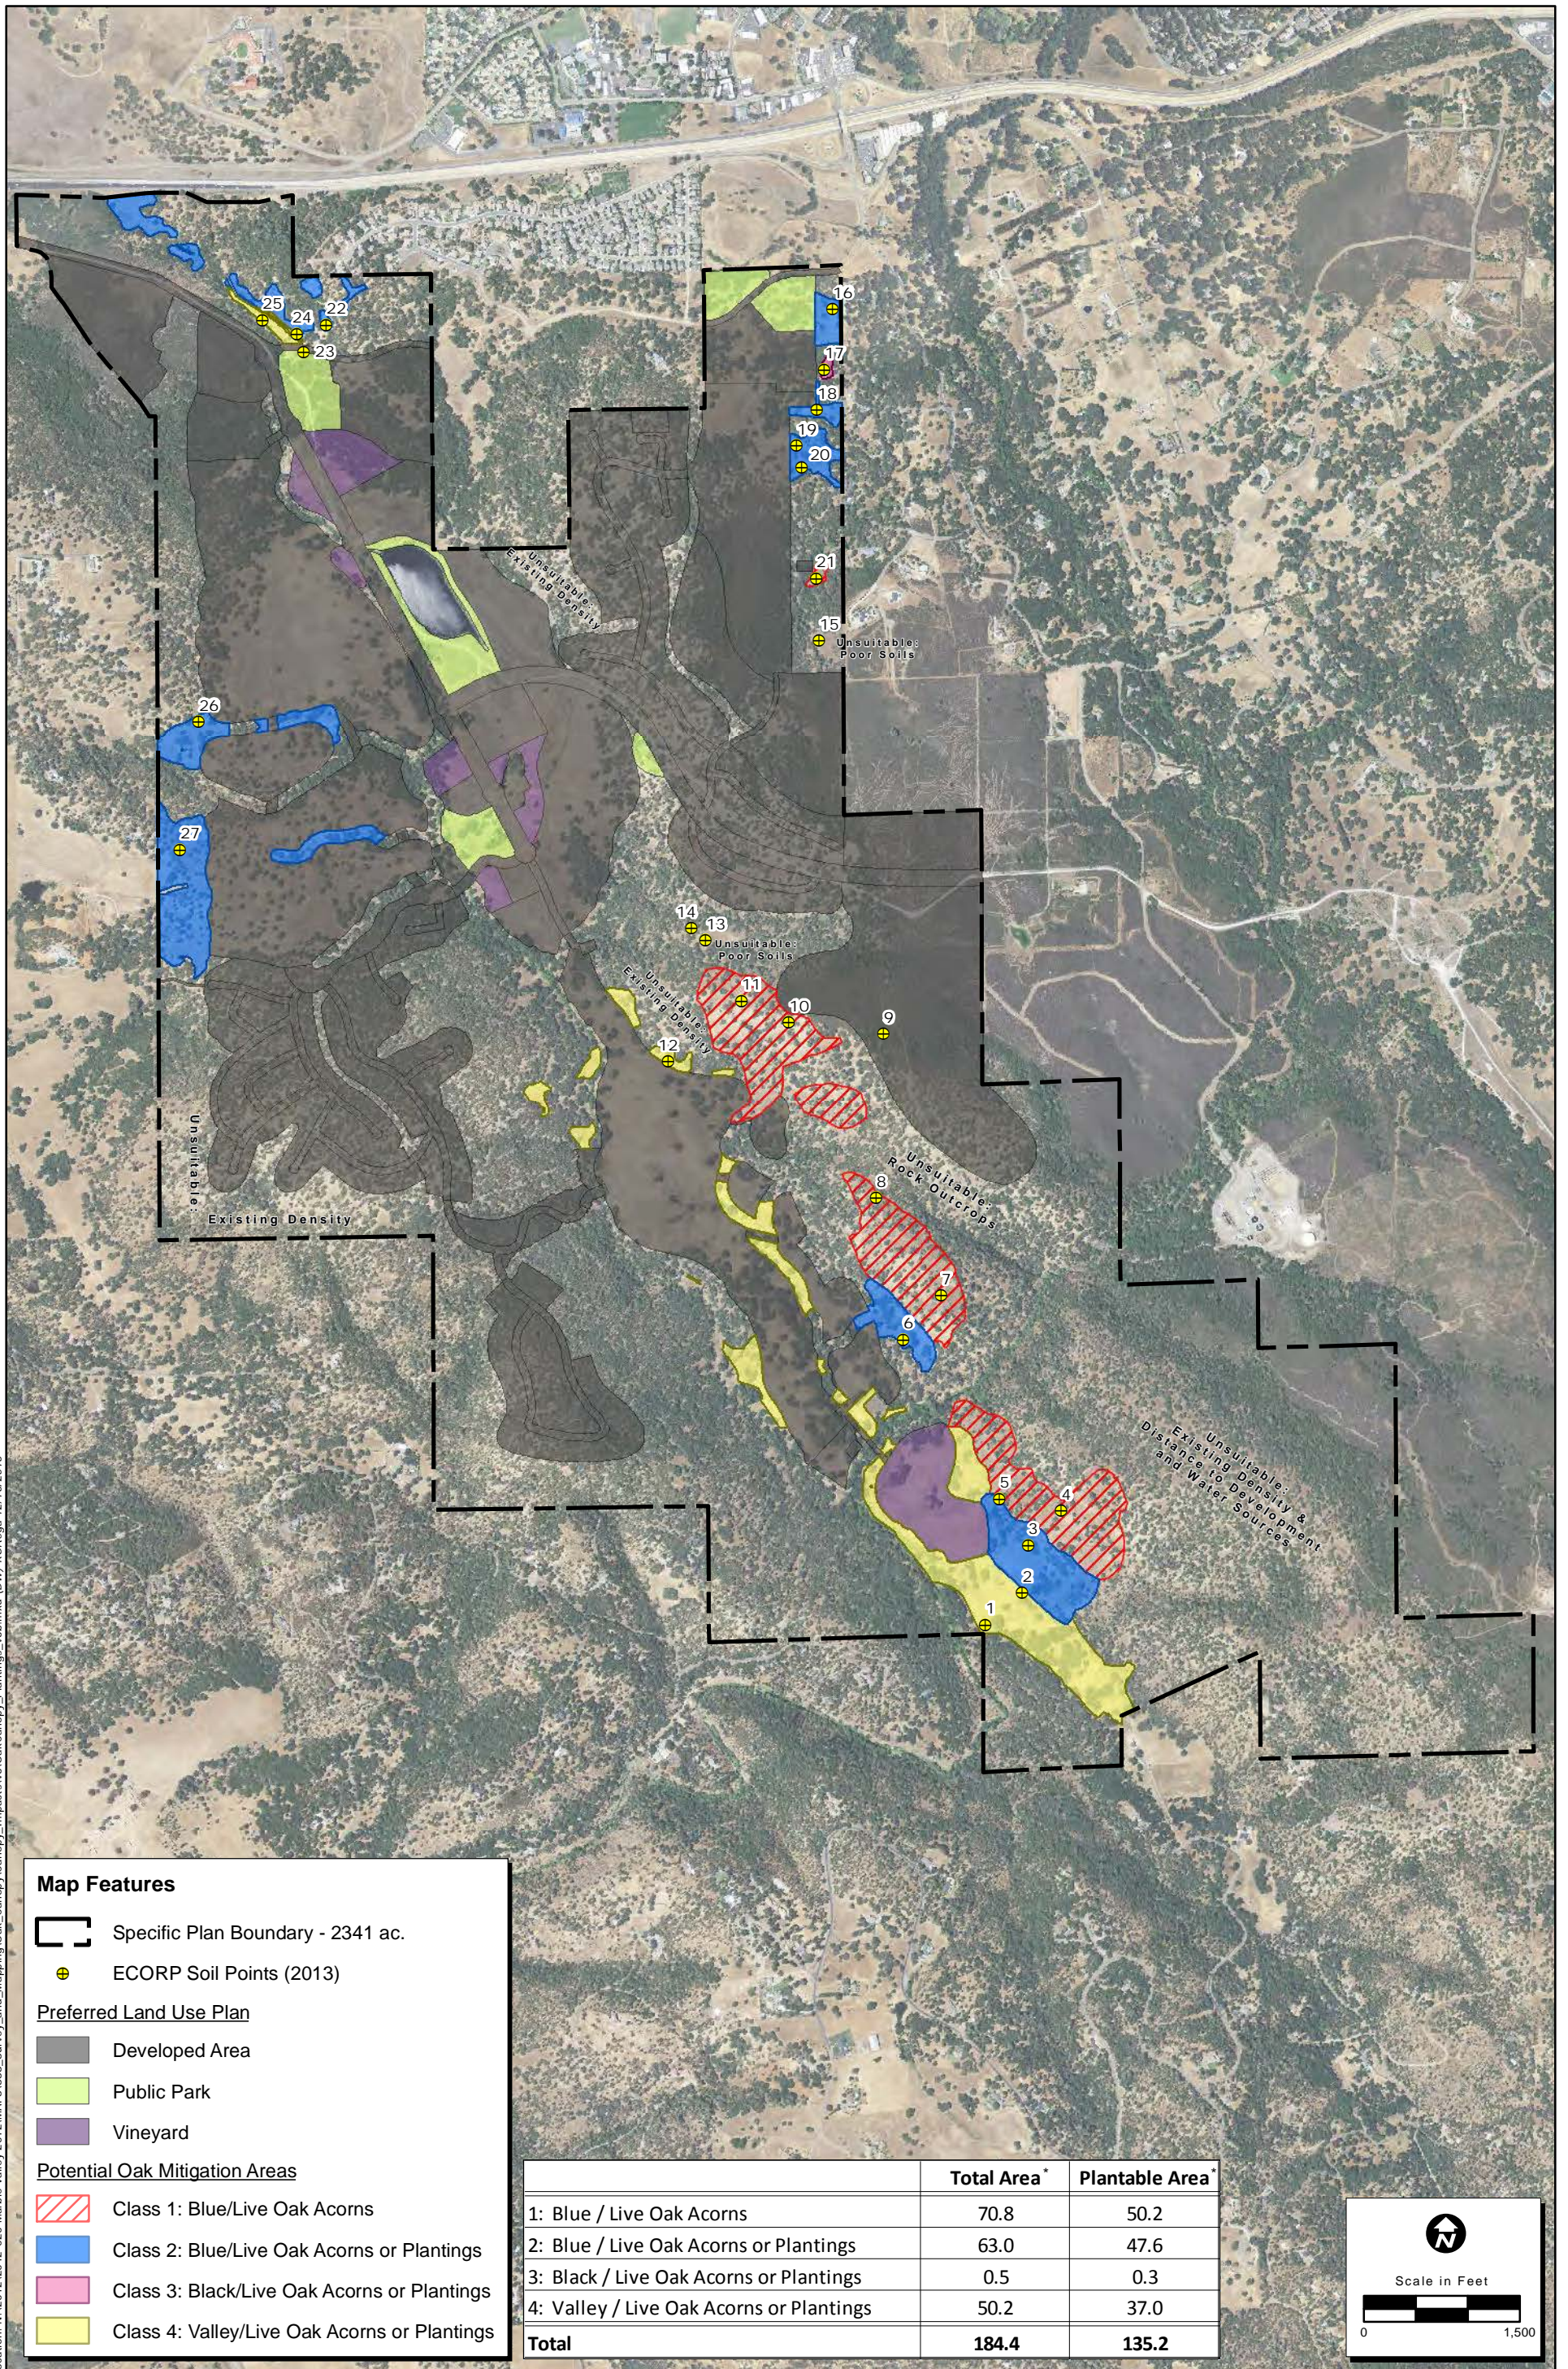

3.3.1.1 On-Site Oak Replacement Area

Within the VMVSP Open Space areas, ECORP identified approximately 184.4 acres of oak replacement areas (Figure 9. *Potential Oak Mitigation Areas*). However, only 135.2 acres are considered plantable space given the existing oak canopy; within these 135.2 acres of plantable space, four classes of species and planting type were established, based on site suitability:

- Class 1 - blue/live oak acorns (± 50 acres);
- Class 2 - a combination of blue/live oak saplings and/or acorns (± 48 acres);
- Class 3 - black/live oak saplings (± 0.5 acres); and
- Class 4 - Valley/live oak saplings (± 37 acres).

Approximately 50.2 acres are suitable for blue/live oak acorns (Class 1). The majority of Class 1 locations are within the Open Space areas in the south-central portion of the Project area. In general, acorn plantings are ideal for rocky soils where digging is difficult. These areas contain large rock outcrops, steep slopes, and shallow, rocky soils. If supplemental irrigation is feasible, it is recommended to ensure survivorship of the acorns.

- Class 2: Blue/Live Oak Acorns or Plantings
- Class 3: Black/Live Oak Acorns or Plantings
- Class 4: Valley/Live Oak Acorns or Plantings

	Total Area*	Plantable Area*
1: Blue / Live Oak Acorns	70.8	50.2
2: Blue / Live Oak Acorns or Plantings	63.0	47.6
3: Black / Live Oak Acorns or Plantings	0.5	0.3
4: Valley / Live Oak Acorns or Plantings	50.2	37.0
Total	184.4	135.2

*Note: Rounding errors may occur in acreage tables.

Figure 9. Potential Oak Mitigation Areas

Oak saplings are suitable for soils with fewer, smaller rocks and where water is available for irrigation. In these areas, acorns can also be planted. Areas that are suitable for either saplings or acorns are classified as Class 2, and there are approximately 47.6 acres scattered around the site within this classification.

Approximately 0.3 acre was identified as suitable for black/live oak saplings (Class 3). This was one small area in the northeast corner of the Project. Approximately 37 acres are suitable for Valley/live oak saplings (Class 4). These areas are scattered within the Open Space areas within the central part of the Project area. Areas that are suitable for Class 4 included low gradient areas and/or areas adjacent to creek channels where there tends to be deep soils with higher soil-water content.

3.3.1.2 On-Site Temporarily Impacted Areas

The Project, as currently designed, will have ± 43 acres of temporarily impacted areas (i.e., graded slopes) that are proposed as oak mitigation areas to partially mitigate for oak impacts. The graded slopes will likely have water available for irrigation, making them appropriate for live plantings (Class 2).

3.3.1.3 Off-Site Mitigation

Approximately 58.5 acres of potential oak mitigation areas have been identified within the open space areas on the Serrano Development and Central El Dorado Hills Specific Plan (CEDHSP) located less than two miles from the site. Following the same methodology described in Section 3.1 for the on-site oak replacement areas, ECORP conducted a study to determine potential oak mitigation areas within the off-site area. Based on the results of the study, approximately 57.6 acres are considered plantable space within the potential oak mitigation areas given the existing oak canopy. Approximately 48.3 acres were identified for Class 2 plantings and ± 9.3 acres were identified for Class 4 plantings (Figure 10. *Potential Off-Site Oak Tree Mitigation Areas for the Village of Marble Valley Specific Plan*). While only 49 acres of additional mitigation areas are needed to comply with Option A, ECORP identified a total of 57.6 acres of plantable space. The off-site planting areas will be refined as needed to comply with the mitigation requirement.

Figure 10. Potential Off-Site Oak Tree Mitigation Areas for The Village of Marble Valley Specific Plan

3.3.1.4 On-Site Replacement and Additional Plantings.

Within several of the proposed land use types, the project design has incorporated minimization measures to reduce the amount of oak impacts (Figure 11. *On-Site Planting and Replacement Areas*). For example, within the custom residential lots, grading and tree removal will only occur within the construction footprint for the proposed house, driveway and limited ancillary features. In addition, the Project proposes to plant a replacement tree for each tree removed within the footprint at a 1:1 ratio. All replacement plantings will occur within the same lot as the original tree removal. As a result, the lot will have at minimum the same number of trees after construction is completed and in time a similar acreage of oak canopy.

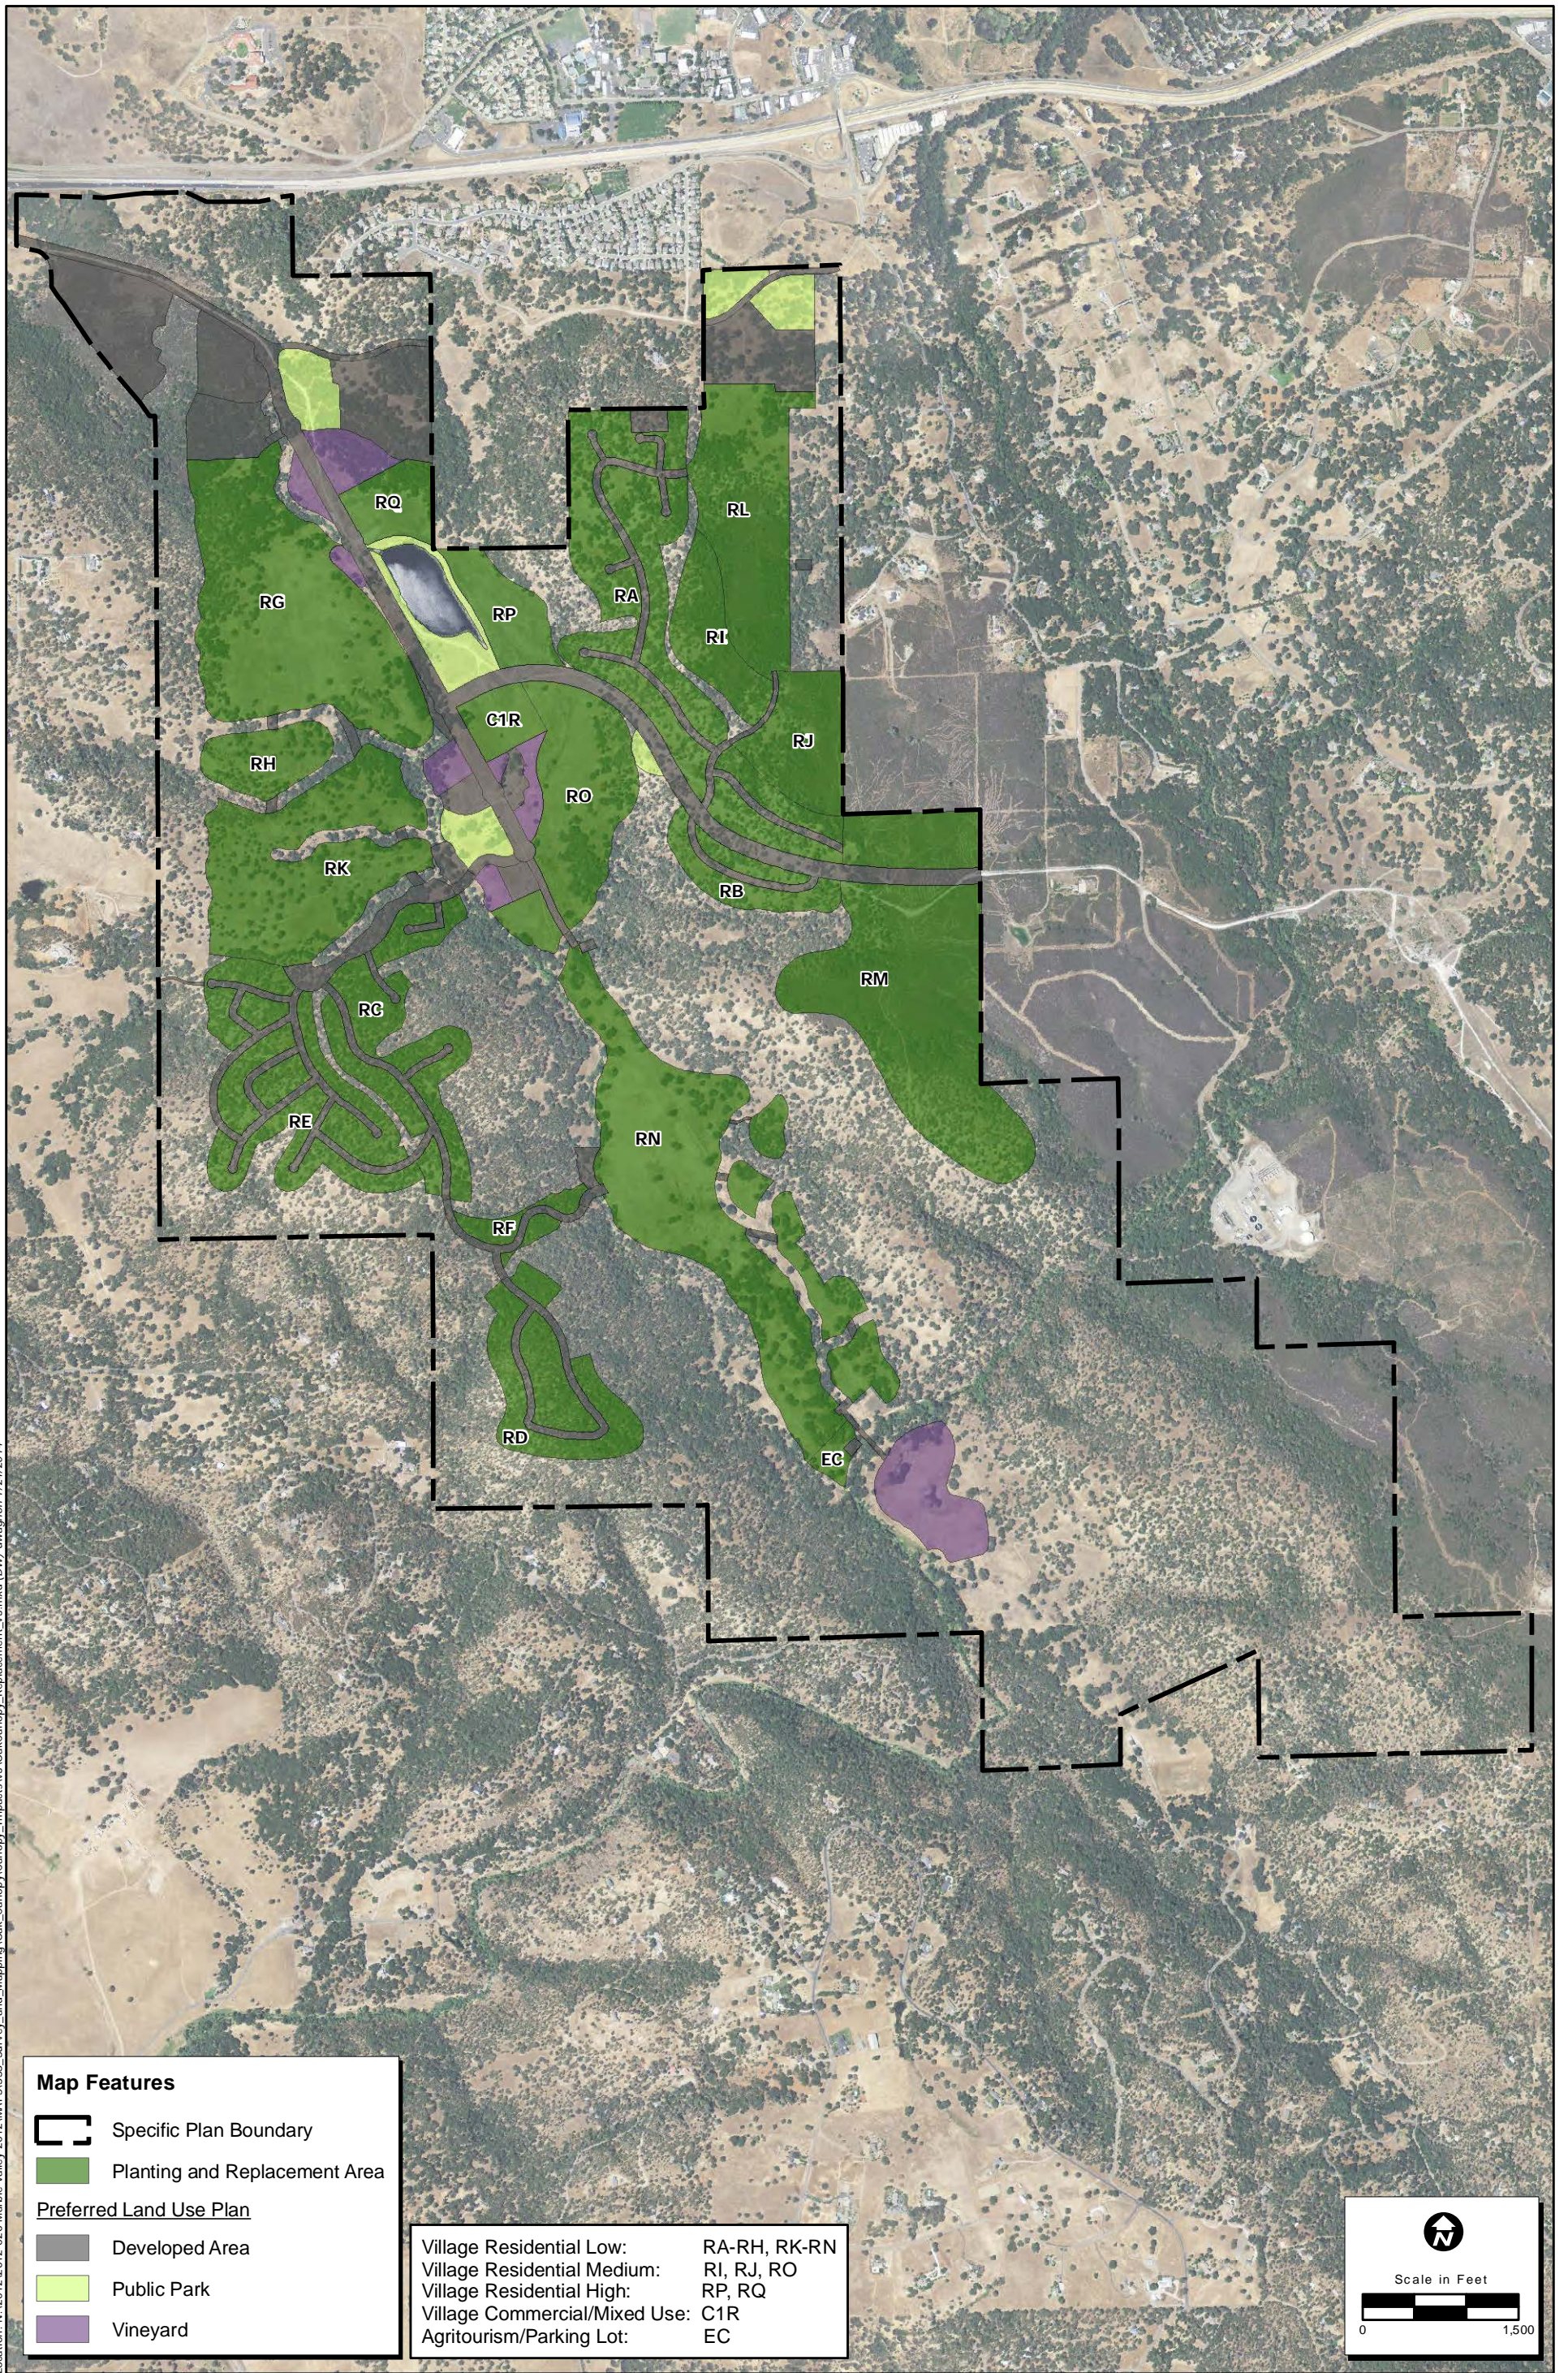

In addition there will be oak tree plantings that will be required within each individual pad graded lot as well as for all multi-family attached product types. These minimum oak plantings will be required for both front and rear yards for single family detached lots, as well as a defined percentage of the common areas for attached type products. Commercial and other non-residential common areas will also be required to plant a certain percentage of oak trees.

Based on tentative lot design, it is anticipated that 5,995 trees will be replanted or planted within the proposed residential development areas. The applicant is proposing a credit of 0.5:1 for these trees and this credit will be applied to the final number of replacement trees that are required for the project. Section 3.3.2 discusses planting amounts in more detail and how this credit would apply.

3.3.2 Planting Types and Amounts

Option A requires that the replacement of removed tree canopy shall be at a density of 200 trees/acre or as recommended by a qualified professional. The County defines a replacement tree as either a one-gallon sapling or three acorns.

Figure 11. On-Site Planting and Replacement Areas

A total of 227.2 acres of oak canopy are required to be planted, based on the current conceptual design for the Project. At a rate of 200 trees/acre, a total of 45,440 one-gallon saplings or 136,320 acorns are required as mitigation for these impacts. However, the project may impact up to 227.6 acres as allowed by Option A. The above values give perspective on the number of saplings or acorns needed to meet the requirements of Option A, and there will be a combination of saplings and acorns used at the site as determined by the four Classes previously described. In addition, the plantings will be completed in a phased manner consistent with the phased approach of the Project.

Tables 3, 4, and 5 below, show the planting class and available acres for the class within each mitigation type (on-site replacement area, temporarily impacted area, and off-site mitigation area) based on an impact of 227.2 acres. The total number of acorns and/or saplings is also shown based on the density requirements of Option A (i.e., 200 trees per acre with one sapling or three acorns equaling one tree). The totals presented are based on the total plantable acreage within the three mitigation sites, which encompass more acreage than is needed to comply with Option A.

Table 3 – On-Site Replacement Areas - Oak Mitigation Plantings		
Planting Class	On-site Oak Replacement Area (acres)	# of acorns/saplings
Class 1: Blue/Live Oak Acorns	50.2	30,120 acorns
Class 2: Blue/Live Oak Saplings or Acorns	47.6	9,520 saplings ¹
Class 3: Black/Live Oak Saplings	0.3	60 saplings
Class 4: Valley/Live Oak Saplings	37.0	7,400 saplings
Total	135.2	30,120 acorns/ 16,980 saplings

¹Assumes irrigation is available and only saplings are planted.

Table 4 – Temporarily Impacted Areas - Oak Mitigation Plantings		
Planting Class	Temporarily Impacted Areas (acres)	# of acorns/saplings
Class 1: Blue/Live Oak Acorns	--	
Class 2: Blue/Live Oak Saplings or Acorns	43.0	8,600 saplings ¹
Class 3: Black/Live Oak Saplings	--	
Class 4: Valley/Live Oak Saplings	--	
Total	43.0	8,600 saplings¹

¹Assumes irrigation is available and only saplings are planted.

Planting Class	Off-site Oak Mitigation Area (acres)	# of acorns/saplings
Class 1: Blue/Live Oak Acorns	--	
Class 2: Blue/Live Oak Saplings or Acorns	48.3	9,660 ¹
Class 3: Black/Live Oak Saplings	--	
Class 4: Valley/Live Oak Saplings	9.3	1,860 ¹
Total	57.6²	11,520²

¹ Assumes irrigation is available and only saplings are planted.
² While a total of 57.6 acres of potential off-site mitigation areas were identified, only 49 acres are required for the project to comply with Option A. The applicant will plant only what is required to comply with Option A.

Mitigation for the Project will be conducted in a phased manner and detailed phasing plans, as they become available, will be submitted to the County as part of each Tentative Map (for most projects) or grading permit (for infrastructure projects, as an example).

As mentioned in Section 3.3.1.4, additional mitigation will occur in the form of oak replacement and plantings within the Custom Residential Lots and within the Residential (low density, medium density and high density) and Mixed Used Commercial land use. Based on calculations of anticipated impacts, a total of 5,995 trees will be planted or replaced within these lots.

The applicants are proposing a credit of 0.5:1 for these trees and this credit will be applied to the final number of replacement trees that are required for the project. Based on a total oak canopy impact of 227.2 acres for the current conceptual design, the project has to plant, 45,440 trees. At a 0.5:1 ratio, the credit for the replacement trees equals 2,998 trees. The applicant is proposing this credit be subtracted from the final sapling requirement. Therefore, the applicant would be required to plant 42,402 trees within the above mentioned mitigation areas. If the total oak impacts increase to 227.6 acres, the applicant is required to plant 45,520 trees under Option A. With the credit applied, the applicant would plant 45,522 trees.

3.3.3 *Planting Installation and Maintenance*

3.3.3.1 Timing and Phasing

Option A requires that oak mitigation is completed prior to final grading or building inspection, and it also requires a high success rate for mitigation plantings. To promote the highest success rate, it is important to properly install and maintain the mitigation plantings, and protect them from ground disturbing activities. As such, this plan proposes that grading will be completed and utilities installed prior to on-site oak tree mitigation planting in order to provide the greatest protection of the replacement trees. To ensure sapling health, irrigation will be needed to supplement plant growth, but may not be feasible in many cases without an existing utility system in place. Irrigation is unnecessary (but recommended) for acorns and these may be planted prior to grading.

The installation and irrigation of the plantings will be concurrent with Project phasing. The project proposes to overplant by at least 10% as contingency for potential mortality within the monitoring period. Project phasing will be contingent on market conditions and focus on providing the most appropriate product at the time of construction. The Applicant will determine the project phasing with the submittal of each small lot tentative map or similar discretionary application that proposes impacts to the oak canopy. At the discretionary permit stage, applicants will submit a Tree Survey, Preservation and Replacement Plan to the County that will identify landmark/heritage trees, and oak impacts on a phase-by-phase basis, provide details on the mitigation plantings (saplings or acorns), and identify specific planting areas associated with that phase of development.

For replacement trees and additional plantings that will occur in the custom lots, individual pad graded lot and multi-family attached product types, the installation of the plantings will occur after construction is completed on a given pad.

3.3.3.2 Maintenance

Proper maintenance of the oak trees within the oak mitigation areas within the first few years will be critical, especially for acorn plantings, as invasive annual grasses are known to out-compete young plants. The trees will receive, at a minimum, twice yearly maintenance as needed which should include applications of supplemental mulch and fertilizer, weeding around the plantings, and incidental litter removal, as needed. Maintenance should occur regularly during the first five years after planting. For trees receiving irrigation, monthly checks of the irrigation system during the dry season and irrigation system repairs, as necessary, should occur.

For replacement trees and additional plantings that will occur in the custom lots, individual pad graded lot and multi-family attached product types, maintenance will be enforced through the projects CC&R's, and the Homeowners Association will oversee the maintenance, care requirements and replacement of dead trees within these areas.

3.3.4 Irrigation Schedule

Irrigation is necessary for the one-gallon plantings to survive. Plantings will be irrigated for a minimum of three years. While irrigation is not required for acorns, it is recommended in order to ensure a higher survival rate. Supplemental irrigation for acorns will be provided, where possible, during summer months. For irrigation of saplings, a recommended irrigation schedule is outlined in Table 6, but will be adjusted as needed after plantings are installed to account for site-specific soil conditions.

Table 6 – Irrigation Schedule for Oak Plantings

<u>Duration</u>	<u>April 15 – September 30</u>	<u>October 1 – April 15</u>
Year 1	8 gallons, once/7-10 days	Irrigation off
Year 2	10 gallons, once/14-20 days	Irrigation off
Year 3	10 gallons, once/21-30 days	Irrigation off
Year 4	Monitor	Discontinue system

** Recommended schedule. Actual schedule will depend on the weather pattern of a given year.*

Irrigation will be gradually decreased and finally eliminated during the monitoring period to ensure that the plantings will have long-term survival without irrigation. Irrigation will deliver deep, infrequent watering and will typically take place between April 15 and September 30 of each year. This will be adjusted for seasonal variations if a year is particularly hot earlier or later in the year.

If after the third year it is determined that irrigation of the plantings should continue, then adjustments will be made accordingly to the irrigation schedule in Table 6. The irrigation system should remain in place until the end of the monitoring period. At the end of the monitoring period, the above-ground irrigation equipment can be removed. Irrigation should be timed to allow a minimum of one year of monitoring after irrigation has ceased.

Acorn collection, storage and Planting will occur according to Attachment C. Plant installation and establishment will follow conceptual plans described in Attachment D, Attachment E, and Attachment F. These detail installation timing, design, and planting as well as irrigation for planting and acorns.

3.4 Mitigation Monitoring and Reporting

3.4.1 Monitoring Schedule

Option A requires that one-gallon plantings shall be maintained and monitored annually for ten years, acorn plantings shall be maintained and monitored for 15 years, and a combination of plantings and acorns shall be maintained and monitored for 15 years. The Project will be developed in a phased manner. Therefore, the required oak mitigation will also be phased based on the impacts for a given phase of development.

For replacement trees and additional plantings that will occur in the custom lots, individual pad graded lot and multi-family attached product types, maintenance will be enforced through the projects CC&R's, and the Homeowners Association will oversee the maintenance, care requirements and replacement of dead trees within these areas.

3.4.2 *Monitoring Methods*

Planted trees within oak mitigation areas will be monitored to ensure that success criteria are met. A representative sampling of vigor, height, and canopy diameter for each tree species will be conducted. Vigor will be based on qualitative comparisons to on-site conditions of leaf turgor, stem caliber, leaf color, and foliage density. Monitoring will be conducted over a 10 to 15-year period starting the year after initial installation.

Monitoring protocol will involve locating all previously numbered trees and shrubs to determine their survivorship, estimating height, assessing overall condition/health, and measuring DBH and drip line radius.

Plant condition will be ranked according to the following scale:

- Good - healthy foliage and vigorous growth;
- Fair - healthy foliage, but minimal apical growth;
- Poor - few green leaves present and no apparent apical growth; or
- Dead.

Plant height will be measured in feet and plants grouped according to the following height intervals:

- Less than two feet;
- Two feet to five feet; or
- Greater than five feet.

Calculated results will include the total number of plantings monitored, the condition and height class of each plant found, annual survival rate, and cumulative survival rate. The annual survival rate is calculated according to the following formula:

$$\text{Annual Survival Rate (\%)} = \frac{\text{total \# alive during survey}}{\text{total \# alive in previous season}} \times 100$$

The cumulative survival rate was calculated according to the following formula:

$$\text{Cumulative Survival Rate (\%)} = \frac{\text{total \# alive during survey}}{\text{required plantings}} \times 100$$

For replacement trees and additional plantings that will occur in the custom lots, individual pad graded lot and multi-family attached product types, maintenance will be enforced through the Project's CC&R's, and the Homeowners Association will oversee the maintenance, care requirements and replacement of dead trees within these areas.

3.4.3 Success Criteria

Option A requires that the canopy density achieved by the replacement oaks in the oak mitigation areas must match that of the canopy that was removed by the end of 15 years. Achieving the original canopy density within 15 years will be challenging regardless of whether acorns or saplings are planted because the majority of the potential oak mitigation area was most suitable for blue oaks. Blue oaks grow slower than the other oak species (i.e., live, Valley, and black oaks). Faster-growing species of oaks could be planted in these locations, but they are not likely to be successful or persist in these locations. Regardless of oak species, the canopy density of the replacement oaks will be impracticable to measure after 15 years of growth. For this reason, success will be defined by survival rates rather than canopy cover. Option A stipulates a 90% survival rate for planted trees. To achieve success with a 90% survival rate, overplanting will occur. The Project will overplant by 10% to ensure the 90% survival rate is achieved.

The proposed final success criterion and replanting criterion for the mitigation oak plantings is shown in Table 7.

Table 7 – Proposed Success and Replanting Criteria for Oak Plantings

- 1) Plantings must have an 90% cumulative total survival rate at the end of the ten to fifteen year monitoring period for saplings and acorns, respectively.
 - 2) Replanting must occur within one year of the cumulative survival rate dropping below 90%, and new plants will be monitored for an additional 15-year period.
-
-

For replacement trees and additional plantings that will occur in the custom lots, individual pad graded lot and multi-family attached product types, maintenance will be enforced through the Project's CC&R's, and the Homeowners Association will oversee the maintenance, care requirements and replacement of dead trees within these areas.

3.4.4 Reporting

An annual mitigation monitoring report documenting tree locations, a description of the planting areas, tree survivorship, an evaluation of the success rating per success criteria assessment, and a report concerning any necessary maintenance, complete with photographs taken at distinct photo points, will be submitted to the County by December 1 of each year for a ten-year period for plantings and a 15-year monitoring period for acorns. This will include all oak plantings within the oak mitigation areas. Additionally, the monitoring report will include recommendations for action during the following years as specified in this document for the Project (e.g., reporting requirements, replacement criteria for replantings). The first report shall be submitted approximately one year after planting.

The provisions of the monitoring program shall be placed into a standard "Notice of Restriction" document and recorded on the title of the property. Once the 10 to 15 years of monitoring has been successfully completed, the County may record a release of the Notice of Restriction.

For replacement trees and additional plantings that will occur in the custom lots, individual pad graded lot and multi-family attached product types, maintenance will be enforced through the Project's CC&R's, and the Homeowners Association will oversee the maintenance, care requirements and replacement of dead trees within these areas.

3.5 Funding Mechanism

Funding mechanisms (i.e., endowments, performance bonds, HOA fees) for the installation, monitoring, maintenance, and replacement of failed plantings that may be needed during the required 10- to 15-year monitoring period will be provided in, or appended to the final draft of

this report prior to the first small lot of tentative maps. Additionally, the financially responsible party, including name, address, telephone number, and email (if available), will be identified.

3.6 Findings and Recommendations

Based on the oak canopy retention and impact analysis, the 2,341-acre Project has 1,137.8 acres of oak canopy, and will be impacting 227.2 acres of oak canopy as the project is currently designed. However, the Project may impact up to 227.6 acres and still meet the 80% oak canopy retention requirement of Option A.

Four mitigation options have been proposed for the Project to mitigate for the 227.2 acres of impact as currently designed. First, approximately 135.2 acres of oak restoration areas have been identified as plantable space within the Open Space areas within the Project. A combination of saplings and acorns will be planted in these areas. Second, an additional 43 acres within the Development area will be temporarily impacted (i.e. graded slopes), and will be used for oak mitigation saplings and/or acorns after grading and utility installation is complete. The remaining 49 acres of required mitigation will occur within proposed oak tree mitigation areas at the off-site Serrano property or the proposed Central El Dorado Hills Specific Plan Project area. Finally, in addition to these mitigation measures, the applicant proposes on-site oak replacement within certain land use types where canopy retention rates are already high (e.g., custom residential lots). Replacement will occur at a 1:1 ratio and plantings will occur within the same lot where impacts will happen. Also, additional oak plantings will be required within the individual pad graded lot and multi-family attached product types. The applicant proposes a partial credit (0.5:1) towards the final number of required plantings for these replacement and additional trees.

The Project will be built in phases and the oak mitigation will follow this phased approach. Once grading has occurred and utilities have been installed within the Project, on-site oak plantings will occur, utilizing the previously discussed phased approach. Installing the plantings after initial phase build-out will reduce disturbance and ultimately lead to higher survival rates. The Project will comply with the 90% survival rate at the end of the 10-15 year monitoring period. To achieve this, the Project will overplant by at least 10% to ensure a 90% survival

rate at the end of the monitoring period. Additionally, if the survival rate drops below 90%, replacement trees will be added the following year.

With proper protection of preserved trees during construction, installation and maintenance of plants within the appropriate planting sites, and the ability to provide necessary irrigation, the mitigation measures outlined in this Plan should sufficiently minimize impacts and protect existing oak woodlands and associated biological resources as required by the County General Plan.

4.0 CERTIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this Biological Resources Study and Important Habitat Mitigation Plan, and that the facts, statements, and information presented herein are true and correct to the best of my knowledge and belief.

SIGNED: Hal Freeman DATED: 01/24/14

ATTACHMENT A

Interim Interpretative Guidelines for El Dorado County General Plan Policy
7.4.4.4 (Option A)

**INTERIM INTERPRETIVE GUIDELINES
FOR EL DORADO COUNTY
GENERAL PLAN POLICY 7.4.4.4 (OPTION A)**

**ADOPTED NOVEMBER 9, 2006
AMENDED OCTOBER 12, 2007**

BACKGROUND

The adopted 2004 El Dorado County General Plan, Conservation and Open Space Element provides for the conservation and protection of soils, minerals, water, wildlife and fisheries, vegetation, cultural resources, and open space. Policies adopted in this element serve to guide the design of new development to meet these objectives. Policy 7.4.4.4 (Option A), reproduced below, addresses oak canopy retention standards. These Guidelines are intended to clarify the scope and implementation of Option A of this policy and provide for a process to consider limited modifications to oak canopy replacement and retention requirements for existing legal parcels if necessary to ensure reasonable use of those parcels. Option B (Mitigation Fee) will be available upon completion of the Oak Woodland Management Plan (OWMP) and related fee studies and implementing ordinances.

OBJECTIVE 7.4.4: FOREST AND OAK WOODLAND RESOURCES

Protect and conserve forest and woodland resources for their wildlife habitat, recreation, water production, domestic livestock grazing, production of a sustainable flow of wood products, and aesthetic values.

Policy 7.4.4.4

For all new development projects (not including agricultural cultivation and actions pursuant to an approved Fire Safe Plan necessary to protect existing structures, both of which are exempt from this policy) that would result in soil disturbance on parcels that (1) are over an acre and have at least 1 percent total canopy cover or (2) are less than an acre and have at least 10 percent total canopy cover by woodlands habitats as defined in this General Plan and determined from base line aerial photography or by site survey performed by a qualified biologist or licensed arborist, the County shall require one of two mitigation options: (1) The project applicant shall adhere to the tree canopy retention and replacement standards described below; or (2) the project applicant shall contribute to the County's Integrated Natural Resources Management Plan (INRMP) conservation fund described in Policy 7.4.2.8.

Option A

The County shall apply the following tree canopy retention standards:

Percent Existing Canopy Cover	Canopy Cover to be Retained
80–100	60% of existing canopy
60–79	70% of existing canopy
40–59	80% of existing canopy
20–39	85% of existing canopy
10-19	90% of existing canopy
1-9 for parcels > 1 acre	90% of existing canopy

- Under Option A, the project applicant shall also replace woodland habitat removed at 1:1 ratio.
- Impacts on woodland habitat and mitigation requirements shall be addressed in a Biological Resources Study and Important Habitat Mitigation Program as described in Policy 7.4.2.8.
- Woodland replacement shall be based on a formula, developed by the County, that accounts for the number of trees and acreage affected.

Note: For purposes of implementing these guidelines, “tree canopy” retention shall mean oak tree canopy retention and replacement of “woodland habitat” shall mean replacement of oak canopy.

DEFINITIONS

For the purposes of these Guidelines, the following words and phrases shall have the meanings respectively ascribed to them by this section:

1:1 Woodland Replacement (Replacement Land Area/Replacement Tree/Replacement Acorn-Density Ratio): Replacement of removed tree canopy shall be at a 200 trees (saplings or one gallon trees) per acre density or as recommended by a qualified professional. Replacement is subject to intensive to moderate management¹ and 10 to 15 years of monitoring, respectively. The survival rate shall be 90 percent as specified in the approved monitoring plan for the project, prepared by a qualified professional. Acorns may be used instead of saplings or one gallon trees. If acorns are used, they

¹ Management intensity assumes that 10 years after planting 1 year old saplings that trees that have been nurtured with high management intensity will be on average 2 inches DBH with 90 percent survival; moderate management intensity will result in trees that are on average 1.5 inches DBH with 85 percent survival. See Standiford et al 2002.

shall be planted at a 3:1 ratio as determined by the tree replacement formula². The replacement is as follows:

- Replacement replanting from saplings or one-gallon trees, that are locally sourced, shall follow this formula for ratios:

(Replacement Area in acres) x 200 trees per acre = the total number of replacement trees to be replanted

- Replacement replanting by acorn shall be from locally-sourced acorns (acorns gathered locally). The replacement ratio by acorn replanting shall be obtained by the following formula:

(Replacement Area in acres) x (200 trees per acre) x (3 acorns per tree) = the total number of acorns to be replanted

Agricultural Conversion: As defined by General Plan Policy 7.1.2.7.

Agricultural Cultivation/Operations: As defined by General Plan Policy 8.2.2.1.

Agricultural Lands: As defined by General Plan Policies 2.2.1.2 and 8.1.1.8, and further, Policy 8.2.2.1.

Arborist: A person certified by the International Society of Arboriculture (I.S.A.) or other recognized professional organization of arborists that provides professional advice and licensed professionals to do physical work on trees in the County.

Biological Resources Study and Important Habitat Mitigation Program: The Biological Resources Study is an evaluation of a project site that quantifies the amount of important habitat, by habitat type, and addresses the potential for the project to adversely affect important habitat through conversion or fragmentation. The Important Habitat Mitigation Program identifies options that would avoid, minimize, or compensate for impacts on important habitats in compliance with General Plan policies 7.4.4.4 and 7.4.5.2, including a monitoring and reporting component (General Plan 2004 Measure CO-U). The Important Habitat Mitigation Program includes components which address “Certified Arborist Reports” and “Tree Protection Plans”. The Biological Resources Study and Important Habitat Mitigation Program shall be prepared by a qualified professional. See separate guidelines for detailed requirements.

CDF: California Department of Forestry.

² McCreary DD. 2001. *Regenerating rangeland oaks in California*. Berkeley (CA): University of California, Agriculture and Natural Resources. Communication Services Publication #21601. 62 p.

Construction/Disturbance Area: Any area in which movement of earth, alteration in topography, soil compaction, disruption of vegetation, change in soil chemistry, and any other change in the natural character of the land occurs as a result of site preparation, grading, building construction or any other construction activity.

Diameter at breast height (Dbh): The measurement of the diameter of the tree in inches, specifically four (4) feet six (6) inches above natural grade on the uphill side of the tree. In the case of trees with multiple trunks, the diameter of all stems (trunks) at breast height shall be combined to calculate the diameter at breast height of the tree.

Fire Safe Plan: Defined by the El Dorado County Department of Forestry Guidelines (http://www.co.el-dorado.ca.us/building/PDF/Booklets/Fire_safe_regs.pdf), and the CDF General Guidelines for Creating Defensible Spaces (http://www.bof.fire.ca.gov/pdfs/4291finalguidelines2_23_06.pdf), and as defined by Goal 6.2 Fire Hazards of the Public Health, Safety, and Noise element of the General Plan.

Given Unit of Land: The land contained within the project site. If the project site, prior to any proposed land division, is comprised of multiple parcels, the parcels may be treated as a single given unit of land for the purpose of calculating oak canopy cover and retention requirements.

Habitat: The physical location or type of environment in which an organism or biological population lives or can be found (General Plan 2004).

Heritage trees: Trees planted by a group or individuals or by the City or the County in commemoration of an event or in memory of a person figuring significantly in history (General Plan 2004).

Important Habitat: Defined as habitats that support important flora and fauna, including deer winter, summer, and fawning ranges and migration routes; stream, river, and lakeshore habitat; fish spawning areas; seeps, springs, and wetlands; oak woodlands; large expanses of native vegetation; and other unique plant, fish, and wildlife habitats generally located within or adjacent to designated Ecological Preserves, the Important Biological Resource Corridor Overlay, or in other locations otherwise recognized as being important habitat by Federal, State or County agencies.

Landmark Tree: Trees whose size, visual impact or association with a historically significant structure or event has led the government to designate them as landmarks (General Plan 2004).

Licensed engineers and land surveyors: Professionals that are licensed by the California Board for Professional Engineers and Land Surveyors.

Oak Canopy Cover: The area directly under the live branches of the oak trees, often defined as a percent, of a given unit of land.

Oak Woodlands: A given unit of land, with one or more groupings of live trees, where the dominant species (i.e. a plurality) of the live trees within the groupings are native oaks (genus quercus). "Stand" means a group or groupings of trees.

Oak woodlands with oak tree canopy coverage of less than 10 percent of the project site for parcels one acre or less in size, or oak woodlands with oak tree canopy coverage of less than 1 percent on parcels of land that are more than one acre in size, are **not** subject to the oak tree canopy cover retention requirements of Policy 7.4.4.4 Option A.

Protected Trees: Trees of the genus quercus (oak trees), landmark, and heritage trees, which are subject to County review pursuant to General Plan Policies 7.4.4.4, 7.4.5.1, and 7.4.5.2.

Qualified Professional: An arborist certified by the International Society of Arborists, a qualified wildlife biologist, or a registered professional forester (RPF).

Qualified Wildlife Biologist: A professional with a BA or BS or advanced degree in biological sciences or other degree specializing in the natural sciences; professional or academic experience as a biological field investigator, with a background in field sampling design and field methods; taxonomic experience and knowledge of plant and animal ecology; familiarity with plants and animals of the area, including the species of concern; and familiarity with the appropriate county, state, and federal policies and protocols related to special status species and biological surveys.

Registered Professional Forester (RPF): A Registered Professional Forester (RPF) is a person licensed by the State of California to perform professional services that require the application of forestry principles and techniques to the management of forested landscapes. RPFs have an understanding of forest growth, development, and regeneration; soils, geology, and hydrology; wildlife and fisheries biology and other forest resources. RPFs are also trained in fire management and, if involved in timber harvesting operations, have expertise in both forest road design and application of the various methods used to harvest timber (California Licensed Foresters Association).

Removal: The physical destruction, displacement or removal of a tree, or portions of a tree caused by poisoning, cutting, burning, relocation for transplanting, bulldozing or other mechanical, chemical or physical means.

Replacement: See 1:1 Woodland Replacement definition.

Self Certification: Acknowledgment by an applicant constructing a single-family dwelling or accessory structures and appurtenances to a single-family dwelling that the removal

of oak trees not otherwise in compliance with these interim guidelines and Policy 7.4.4.4, is in compliance with General Plan Policy 7.1.2.2 and are therefore exempt from the provisions of Policy 7.4.4.4 as “reasonable use.”
