1 Introduction

El Dorado County is conducting CEQA review of the proposed realignment of approximately 1,600 feet of Latrobe Road north of Ryan Ranch Road, located approximately 4.0 miles south of U.S. Highway 50 in western El Dorado County. The El Dorado County Department of Transportation has prepared this Initial Study to consider the potential for the project to result in one or more significant impacts to the environment pursuant to the California Environmental Quality Act (CEQA) of 1970, as amended (Public Resources Code, Section 21000, et seq.). The County is the CEQA lead agency for the project and this document has been prepared based on the requirements of the state CEQA Guidelines (14 California Administrative Code, Section 14000 et seq.). Based on the results of this Initial Study, the County has determined that the project could have a significant effect on the environment, but mitigations has been identified that would reduce impacts to less than significant. Therefore, with a commitment to implement the mitigation measures identified herein, the County may complete the project CEQA review with a Mitigated Negative Declaration (MND).

This document is divided into the following sections:

- **Section 2, Initial Study Findings**—Provides the County’s CEQA findings pursuant to this Initial Study;
- **Section 3, Project Description**—Provides a detailed description of the proposed project;
- **Section 4, Initial Study Checklists and Supporting Documentation**—Provides CEQA Initial Study resource impact checklists and supporting documentation; and
- **Section 5, Supporting Information Sources**—Provides a listing of sources of information used for the preparation of this document.
- **Appendix A, Mitigation Monitoring and Reporting Plan**—Contains the Mitigation Monitoring and Reporting Plan prepared for the proposed project. The Mitigation Monitoring and Reporting Plan includes a list of required mitigation measures and includes information regarding the County’s policies and procedures for implementation and monitoring of the mitigation measures.

2 Initial Study Findings

1. Project Title:

Latrobe Road Realignment Project

2. Lead agency name and address:

El Dorado County, Department of Transportation
4505 Golden Foothill Parkway
El Dorado Hills, CA 95762

3. Contact person and phone number:

Richard R. Carter, P.E. (916) 358-3554

4. Project location:

The Latrobe Road corridor approximately 800 feet north of the Latrobe Road/Ryan Ranch Road intersection and approximately 4.0 miles south of U.S. Highway 50. (See **Figure 1** in **Section 3** of this Initial Study)

5. Project sponsor's name and address:

N/A

6. General Plan designation:

Rural Residential

7. Zoning:

Residential Agricultural (RA)

8. Description of project:

The proposed project involves the realignment and widening of approximately 1,600 feet of Latrobe Road. The proposed project would widen Latrobe Road from approximately 24 feet to approximately 33 feet and would realign Latrobe Road to improve sight distance and roadway safety features. A more detailed project description is included in **Section 3** of this Initial Study. **Figure 2** in **Section 3** shows the project area and proposed improvements.

9. Surrounding land uses and setting:

The project area is located approximately 4.0 miles south of U.S. Highway 50 (U.S. 50) within the rural area of southwestern El Dorado County. The area is comprised primarily of a single-family residence west of the project area and open grasslands transected by a tributary to Deer Creek east of the project area. Adjacent land use designations of the 2004 *El Dorado County General Plan* are comprised primarily of agricultural lands (AL) and rural residential (RR) uses. One of the two Latrobe Fire Protection District stations is located approximately 0.75 mile southeast of the project area.

Additional information concerning surrounding land uses within and adjacent to the project area is included **Section 3** of this Initial Study.

10. Other public agencies whose approval is required (e.g., permits, financing approval, or participation agreement):

The project may require permits or approvals from the following:

U.S. Army Corps of Engineers - Nationwide Section 404 Discharge Permit

California Department of Fish and Game - Lake/Streambed Alteration Agreement

Central Valley Regional Water Quality Control Board - General Permit for Discharges of Storm Water Associated with Construction Activity; Water Quality Certification

El Dorado County Air Quality Management District – Dust Mitigation Plan

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED:

This Initial Study has determined that in the absence of mitigation the Proposed project would have the potential to result in significant impacts associated with the factors checked below. Mitigation measures are identified in this Initial Study that would reduce all potentially significant impacts to less-than-significant levels.

	Aesthetics		Agricultural Resources		Air Quality
✓	Biological Resources	✓	Cultural Resources		Geology/Soils
	Hazards & Hazardous Materials		Hydrology/Water Quality		Land Use/Planning
	Mineral Resources		Noise		Population/Housing
	Public Services		Recreation		Transportation/Traffic
	Utilities/Service Systems		Mandatory Findings of Significance		

INITIAL STUDY DETERMINATION:

On the basis of this initial evaluation:

	I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
✓	I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
	I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
	I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
	I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

3 Project Description

3.1 Project Location and Land Use Designations

The Latrobe Road Realignment Project¹ (proposed project) is located in the rural area of southwestern El Dorado County (see **Figure 1**). The project is located approximately 4.0 miles south of U.S. Highway 50 (U.S. 50). An existing private driveway constitutes the northern project limit (Mile Post 7.35), while the southern boundary is located at Mile Post 7.0, which is approximately 800 feet north of the Latrobe Road/Ryan Ranch Road intersection. The roadway width within the project area ranges from 24 to 26 feet. The full length of the project area is approximately 0.35 mile.

Latrobe Road runs essentially north-south; however, it runs southeast-northwest throughout the project area. It is surrounded primarily by rural grasslands. Designated land uses adjacent to the project area are identified as rural residential (RR) uses in the 2004 *El Dorado County General Plan*. Existing land uses surrounding the project area include a single-family residence west of the project area and open grasslands transected by a tributary to Deer Creek east of the project area. One of the two Latrobe Fire Protection District stations is located approximately 0.75 mile southeast of the project area.

3.2 Project Purpose and Objectives

Between 2001 and 2006, 13 accidents have been reported between Mile Posts 6.9 and 7.45. The accidents range in severity including hit objects, a head-on collision, sideswipe collisions and an overturned vehicle. This section of roadway has poor sight distance around a horizontal curve adjacent to a steep hillside and narrow shoulders (0 to 2 feet) allowing only a minimal recovery zone. This roadway segment has been identified by the El Dorado County Department of Transportation in the Proposed 2007 Capital Improvement Program as requiring operational and safety improvements as a result of this existing situation. The objective of the Proposed project is:

To improve traffic safety along Latrobe Road between Mile Post 7.0 and 7.35.

¹ The proposed project is included in the 2008 County Capital Improvement Program (CIP) Proposed Five-Year Capital Improvement Plan as the Latrobe Road North of Ryan Ranch Road Project (Project Number 73359). The proposed project referenced in this MND, although entitled the Latrobe Road Realignment Project, is actually County CIP Project Number 73359.

3.3 Proposed Improvements

3.3.1 Roadway Modifications

The proposed project includes the realignment of Latrobe Road approximately 10 feet west between Mile Post 7.25 and Mile Post 7.35 thereby increasing the curve radius of the roadway and improving sight distance. The project also proposes to widen the shoulder width from less than one foot on each side to 5-feet on the west side and 4-feet on the east side between Mile Post 7.0 to 7.35 to increase the recovery zone. (See **Figure 2.**)

The realigned traffic lanes would be restriped to 12 feet wide in both the northbound and southbound directions. Approximately 330 feet of metal beam guardrail would be installed on the east side of the roadway between stations 21+10 and 24+37. Due to proposed cut and fill within the project area, the proposed project would require the relocation of fencing. Relocated fence would be situated approximately 5 feet behind the proposed grade. The location of the proposed fencing would be coordinated with the private property owners. On the east side of the road, approximately 170 feet of gabion would be installed between stations 17+80 and 19+50 to support the embankment.

The proposed project would require earthwork quantities of approximately 5,800 cubic yards of cut and 1,000 cubic yards of fill. Excess dirt will be hauled away from job site.

3.3.2 Lighting, Utilities and Drainage Facilities

There are no existing lighting fixtures adjacent to the project roadway alignment. Lighting fixtures are limited to exterior light fixtures at the private residence adjacent to the project area. The project does not propose the installation of lighting features adjacent to the project roadway alignment.

The proposed project includes the relocation of approximately eight overhead utility poles (telephone poles). Overhead electric service lines (PG&E) exist at the southern end of the project but relocation is not anticipated. No other utility facilities are located within the project area. Coordination with the appropriate utility service provider would be conducted prior to utility relocation to minimize utility service disruption.

The proposed project includes upgrade/replacement of an existing cross culvert and construction of a new cross culvert which would convey stormwater from the west side of the roadway to the east side. A flared end section and energy dissipater on the east side outlet would minimize erosion. Stormwater would be naturally conveyed to the Deer Creek tributary, which runs parallel and adjacent to the east side (northbound segment) of the proposed roadway alignment.

3.3.3 Vegetation Removal and Replacement

Construction activities associated with the roadway realignment would require some vegetation removal. Plants selected for revegetation would be appropriate for the project area and would not include any noxious or invasive weeds. The proposed project does not include landscaping; however, areas graded during construction activities but not paved would be revegetated and would be revegetated to standard for erosion control.

3.3.4 Signage

The proposed project would include the installation of signage within the project area. Signage may include, but would not be limited to, chevron signs, which would delineate the roadway curve and alert motorists of the curve.

3.3.5 Right-of-Way Requirements

The proposed project would require permanent right-of-way acquisition or public road easements for development of the realigned roadway segment. The project would also require the acquisition of slope, drainage, and public utility easements and temporary construction easements (for construction purposes) from adjacent properties. Permanent right-of-way or easement acquisitions would be negotiated with property owners who would be compensated for their acquired property. The County would obtain temporary easements from adjacent parcels to accommodate vehicle and equipment operations during project construction.

3.3.6 Project Construction

The El Dorado County DOT would retain a construction contractor to construct the proposed improvements and the contractor would be responsible for compliance with all applicable rules, regulations and ordinances associated with construction activities and for actual implementation of the construction-related mitigation measures to be adopted for the project. DOT would provide construction inspection and would be responsible for verifying mitigation measure implementation. The proposed project would be constructed in accordance with the Public Contracts Code of the State of California, the State of California Department of Transportation Standard Plans and Standard Specifications, and the Contract, Project Plans, and Project Special Provisions under development by the County of El Dorado Department of Transportation.

The following are a combination of standard and project-specific procedures/requirements applicable to project construction:

- Construction contract special provisions will require that a traffic management plan be prepared. The traffic management plan will include construction staging and traffic control measures to be implemented during construction to maintain and minimize impacts to traffic during construction. Minor traffic stoppages or delays may be allowed if necessary during project construction. Full roadway closures will

- be avoided during project construction and provisions for emergency vehicle movement through the project area will be provided at all times during construction;
- Contract special provisions will require compliance with EDCAQMD Rules 223, 223-1, and 223-2 to minimize fugitive dust emissions and the potential for risk of disturbance to naturally occurring asbestos;
 - Compliance with the California Air Resources Board Airborne Toxic Control Measure at Title 17 Section 93105 addressing Construction, Grading, Quarrying, and Surface Mining activities and with the Asbestos ATCM for Surfacing Applications (California Code of Regulations, Title 17, Section 93106);
 - Contract provisions will require notification of DOT and compliance with California Health and Safety Code Section 7050.5 and California Public Resources Code Section 5097.94 et seq., regarding the discovery and disturbance of human remains should any human remains be discovered during project construction;
 - Contract provisions will require compliance with the El Dorado County Grading Ordinance and Storm Water Management Plan for Western El Dorado County and implementation of Best Management Practices as identified in the National Pollutant Discharge Elimination System permit and/or Storm Water Management Plan;
 - DOT or its construction contractors will conduct early coordination with utility service providers, law enforcement and emergency service providers to ensure minimal disruption to service during construction;
 - DOT and its construction contractors will comply with the State of California Standard Specifications (May 2006 or newer), written by the State of California Department of Transportation, for public service provision;
 - Access to adjacent residential properties will remain open at all times during the construction period; and
 - The project would comply with General Plan Policy 6.5.1.11 pertaining to construction noise.
 - If necessary, night time construction shall be conducted to minimize traffic disruption and will comply with the above ordinances.

The County anticipates that construction of the proposed project would require the construction contractor to close one of the two traffic lanes while construction activities were occurring, resulting in a reversible control (both directions alternating use of a single lane) lane closure. Diversions of traffic would be signed; and barriers, striping, and cones would be used as necessary to guide traffic and delineate temporary lanes. Flagpersons would monitor and guide traffic during periods of reversible control lane closure, equipment movement, or when construction activities were occurring near traffic lanes to ensure public and worker safety.

3.3.7 Construction Schedule

Construction of the proposed project is proposed to commence in Fall 2009 or Spring 2010 and would require approximately three months to complete.

3.4 Permits and Regulatory Approvals

Table 3-1 provides a preliminary listing of the potential permits or other regulatory approvals that may be required for the project.

Table 3-1. Potential Permits and Regulatory Approvals Required for the Project

Approving Agency	Required Permit/Approval	Required For
Federal Agencies		
Army Corps of Engineers	Nationwide Section 404 Discharge Permit. (Clean Water Act, 33 USC 1341)	Discharge of dredge/fill material into "Waters of the United States," including wetlands.
State Agencies		
State Water Resources Control Board, Regional Water Quality Control Board	General Construction Activity Storm Water Permit. Notice of Intent. (40 CFR Part 122)	Storm water discharges associated with construction activity.
	National Pollutant Discharge Elimination System Permit. (Clean Water Act, 33 USC 1251 <i>et seq.</i>)	For storm water discharges associated with industrial activity, unless covered by individual NPDES permit.
	Waste Discharge Requirements. (Water Code 13000 <i>et seq.</i>)	Discharge of waste that might affect groundwater quality.
Department of Fish and Game	Water Quality Certification (Clean Water Act), if project requires Army Corps of Engineers 404 permit.	Discharge into "Waters of the U.S.," including wetlands (see Army Corps of Engineers Section 404 Permit above).
	Lake/Streambed Alteration Agreement. (Fish and Game Code 1603)	Change in natural state of river, stream, lake (includes road or land construction across a natural streambed) which affects fish or wildlife resource.
Local Agencies		
El Dorado County Air Quality Management District	Dust Mitigation Plan	Minimization of construction emissions associated with construction of the proposed project.

This page is intentionally blank.

4 Initial Study Checklists and Supporting Documentation

The resource-specific checklists and supporting discussion have been prepared based on the review of the project area and existing site conditions, review of relevant literature (as cited herein), consideration of the design plans for the proposed project, and discussions with County staff and agencies.

The following provides issue-specific checklists identifying the project's potential to result in significant impacts. Each checklist is followed by a description of the environmental setting within the project area relevant to the issues in each checklist and a discussion of each environmental issue/question in the checklist.

This page is intentionally blank.

4.1 Aesthetics

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project:				
a) Have a substantial adverse effect on a scenic vista?				✓
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?				✓
c) Substantially degrade the existing visual character or quality of the site and its surroundings?			✓	
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?				✓

4.1.1 Environmental Setting

The project area is primarily rural grasslands and is located approximately 4.0 miles south of U.S. Highway 50 (U.S. 50). The project area consists of an existing roadway with oak trees and overhead utility poles on the west of the existing roadway alignment and oak trees on a slope on the east of the existing roadway alignment. One residence is located approximately 500 feet southwest of the project area. No unique scenic resources or notable vistas are present within the project area.

4.1.2 Potential Environmental Effects

- a) *Would the project have a substantial adverse effect on a scenic vista?*

No Impact. The proposed project would result in a relatively minor physical change to the visual characteristics of the immediate project area by widening roadways. The proposed project would require the removal of up to 32 trees and would require the excavation of the embankment on the south side of the existing roadway alignment to accommodate the proposed realignment. Additionally, the proposed project includes the installation of a guardrail and gabions on the north side of the roadway and tree removal within the right-of-way. These features would result in a noticeable change in the character; however, there are no identified scenic vistas within or in the vicinity of the project site, and therefore, the proposed project would have no substantial adverse effects on a scenic vista.

- b) *Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?*

No Impact. The nearest scenic highway designation is on U.S. 50 between and within the City of Placerville and the Tahoe Basin. This designation occurs approximately 14.0 miles northeast of the Proposed project area. As such, the project would not affect aesthetic resources within the proximity of a State scenic highway.

- c) *Would the project substantially degrade the existing visual character or quality of the site and its surroundings?*

Less Than Significant. As discussed, the project would result in a relatively minor physical change to the visual characteristics of the immediate project area by realigning the roadway, installing a guardrail and gabions, and removing trees. These features would result in a slight noticeable change in the character; however, the addition of the proposed project features is not anticipated to substantially degrade the visual quality of the project area and this impact is therefore considered less than significant.

- d) *Would the project create a new source of substantial light or glare that would adversely affect day or nighttime views in the area?*

No Impact. The proposed project does not include the installation of new light sources. Therefore, the proposed project would result in no impact to light or glare.

4.2 Agricultural Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
<p>In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project:</p>				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?				✓
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?				✓
c) Involve other changes in the existing environment which, due to their location or nature, could result in conversion				✓

4.2.1 Environmental Setting

The areas adjacent to the project area currently include some rural residential uses. The California Department of Conservation Farmland Mapping and Monitoring Program “Important Farmland in California, 2002” map identifies the project area with a classification of “Grazing Land” and “Other Land”. No *Prime Farmland, Unique Farmland, or Farmland of Statewide Importance* or lands under Williamson Act contracts are present within the project area.

Parcels immediately adjacent to the project area are zoned “Residential Agricultural” (RA-40 and RA-80).

4.2.2 Potential Environmental Effects

- a) *Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?*

No Impact. The proposed project would require right-of-way acquisition; however, none of the adjacent properties are designated as agricultural land. No agricultural lands (including *Prime Farmland*, *Unique Farmland*, or *Farmland of Statewide Importance*) would be affected by the project.

- b) *Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?*

No Impact. No lands either zoned for agricultural uses or subject to a Williamson Act contract exist within or adjacent to the project area. The proposed project would not disrupt agricultural activities, and does not conflict with existing zoning for agricultural use or a Williamson Act contract.

- c) *Would the project involve other changes in the existing environment, which due to their location or nature, could result in conversion of Farmland to non-agricultural use?*

No Impact. No Farmland is present within the project area, and the project would not result in or create a situation that would contribute to conversion of farmland to a non-agricultural use.

4.3 Air Quality

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?			✓	
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?			✓	
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?			✓	
d) Expose sensitive receptors to substantial pollutant concentrations?			✓	
e) Create objectionable odors affecting a substantial number of people?			✓	

4.3.1 Environmental Setting

The project area is located within the Mountain Counties Air Basin (MCAB) and under the jurisdiction of the El Dorado County Air Quality Management District (EDCAQMD). The San Francisco Bay Area Air Basin and the Sacramento Valley Air Basin lay to the west, and the San Joaquin Valley Air Basin is located to the southwest.

Air Pollutant Sources and Ambient Air Quality

The EDCAQMD regulates air quality through its permit authority for most types of stationary emission sources, and through its planning and review activities for other sources.

Federal and California ambient air quality standards have been established for the following five critical pollutants: ozone, particulate matter, carbon monoxide, nitrogen dioxide, and sulfur dioxide.

Sources of Pollutants

In general, there are five major sources of air pollutant emissions in the air basin, including motor vehicles, industrial plants, agricultural activities, construction activities, and residential burning activities. Motor vehicles account for a significant portion of regional gaseous and particulate emissions. Industrial facilities can also generate substantial gaseous and particulate emissions. In addition, construction, agricultural activities, and the burning of wood in fireplaces for residential heat can generate significant temporary gaseous and particulate emissions (dust, ash, smoke, etc.).

Ozone

Ozone pollution is the most conspicuous type of air pollution, and is often characterized by visibility-reducing haze, eye irritation, and high oxidant concentrations (i.e., “smog”). Ozone is a pollutant of particular concern in El Dorado County and in the Sacramento Valley. Ozone, which is classified as a “regional” pollutant, often afflicts areas downwind of the original source of precursor emissions. Ozone is produced in the atmosphere through photochemical reactions involving reactive organic compounds (ROG) and nitrogen oxides (NO_x). Numerous small sources throughout the region are responsible for most of the ROG and NO_x emissions in the Basin. Ozone can be easily transported by winds from a source area. Winds from the west transport ozone from the Bay Area and the Sacramento Valley Air Basin to the Sierra Nevada foothills. Ozone precursor transport depends on daily meteorological conditions. In the summer, air flowing into the Mountain Counties Air Basin from the Central Valley to the west transports ozone precursors and ozone generated in the Bay Area and the Sacramento and San Joaquin valleys into the MCAB. These transported pollutants predominate as the cause of ozone in the air basin and are largely responsible for the exceedance of the state and federal ozone standard in the air basin. (El Dorado County Air Quality Management District, 2002)

Particulate Matter (PM)

Particulate matter is another pollutant of concern in the MCAB. Particulate matter less than 10 microns in diameter (PM₁₀) and less than 2.5 microns in diameter (PM_{2.5}) refers to substances that can be inhaled into lungs and can potentially cause serious health problems. Common particulate matter sources include construction and demolition activities, agricultural operations, burning, and diesel-fueled vehicle and equipment emissions.

Carbon Monoxide (CO)

Carbon monoxide (CO) is emitted primarily by motor vehicles. Non-reactive, ambient CO concentrations normally follow the spatial and temporal distributions of vehicular traffic. CO concentrations are also influenced by meteorological factors such as wind speed and atmospheric mixing. High levels of CO can impair the transport of oxygen in the bloodstream and thereby aggravate cardiovascular disease and cause fatigue, headaches, and dizziness. CO may form high concentrations when wind speed is low.

Cold temperatures and calm conditions increase the likelihood of a climate conducive to high, localized CO concentrations.

Nitrogen Dioxide (NO₂)

The major sources of nitrogen dioxide (NO₂), essential to the formation of photochemical smog, are vehicular, residential, and industrial fuel combustion. NO₂ is the brown colored gas evident during periods of heavy air pollution. NO₂ increases respiratory disease and irritation and may reduce resistance to certain infections.

Sulfur Dioxide (SO₂)

The major source of sulfur dioxide (SO₂) is the combustion of high-sulfur fuels for electricity generation, petroleum refining, and shipping. In humid atmospheres, sulfur oxides can react with vapor to produce sulfuric acid, a component of acid rain. SO₂ can irritate the lungs, damage vegetation and materials, and reduce visibility.

Lead (Pb)

Gasoline-powered automobile engines are a major source of airborne lead, although the use of leaded fuel is being reduced. Lead can cause blood effects such as anemia and the inhibition of enzymes involved in blood synthesis. Lead may also affect the central nervous and reproductive systems. Ambient lead levels have dropped dramatically as the percentage of motor vehicles using unleaded gasoline continues to increase.

Naturally Occurring Asbestos (NOA)

NOA is known to be present within El Dorado County. Disturbance of serpentine or ultramafic rock has the potential to release NOA into the air. Serpentine rock does not pose a health risk unless it is disturbed in such a manner that causes asbestos-containing particulate matter to be released from the rock into the air creating a health risk. EDCAQMD has adopted an El Dorado County Naturally Occurring Asbestos Review Area Map which identifies those areas more likely to contain NOA. Ground disturbance activities within these areas are subject to additional County regulatory requirements to minimize human exposure potential. The project area is not located within an area identified on the most recent Naturally Occurring Asbestos Review Area Map as being "More Likely to Contain Asbestos" (July 22, 2005).

Ambient Air Quality Standards

Applicable Federal and State standards for each regulated pollution category is provided in **Table 4 -1**.

**Table 4-1
Federal and State Air Quality Standards**

Pollutant	Averaging Time	Federal Standard	State Standard
Ozone	1-Hour	--	0.09 ppm
	8-Hour	0.08 ppm	--
Carbon Monoxide	1-Hour	35.0 ppm	20.0 ppm
	8-Hour	9.0 ppm	9.0 ppm
Nitrogen Dioxide	Annual	0.05 ppm	--
	1-Hour	--	0.25 ppm
Sulfur Dioxide	Annual	0.03 ppm	--
	24-Hour	0.14 ppm	0.05 ppm
	1-Hour	--	0.25 ppm
PM ₁₀	24-Hour	150 µg/m ³	50 µg/m ³
PM _{2.5}	Annual	15 µg/m ³	--
	24-Hour	65 µg/m ³	--
Lead	30-Day Avg.	--	1.5 µg/m ³
	Month Average	1.5 µg/m ³	--

ppm = parts per million

µg/m³ = Micrograms per Cubic Meter

Source: Sacramento Metropolitan Air Quality Management District Guide to Air Quality Assessment, July 2004, with modification to reflect recent federal change in ozone standard

Federal Standards

The 1977 Federal Clean Air Act (CAA) required the U.S. Environmental Protection Agency (EPA) to identify National Ambient Air Quality Standards (NAAQS) to protect public health and welfare. NAAQS have been established for the six criteria air pollutants. (These are included in **Table 4-1**.)

In June of 1997, the EPA adopted new ozone and PM₁₀ standards. The EPA has replaced its previous 1-hour ozone standard of 0.12 ppm and replaced it with an 8-hour standard of 0.08 ppm. The EPA also adopted an additional standard for PM_{2.5}.

Pursuant to the 1990 amendments to the Federal CAA, the EPA has classified air basins (or portions thereof) as either “attainment” or “non-attainment” for each criteria air pollutant, based on whether or not the NAAQS have been achieved. El Dorado County is designated as non-attainment for the federal ozone standard.

State Standards

In 1988, the State of California passed the California Clean Air Act (CCAA, State 1988 Statutes, Chapter 1568) that established more stringent State ambient air quality standards, and set forth a program for their achievement. The California Air Resources Board (CARB) implements State ambient air quality standards, as required in the CCAA, and cooperates with the Federal government in implementing pertinent federal requirements. Further, CARB has responsibility for reviewing and permitting stationary and mobile source air pollutant emissions throughout the state. Like its Federal counterpart, the CCAA designates areas as attainment or non-attainment, with respect to the state AAQS. Under the state AAQS and based on 2004 designations, El Dorado County is designated non-attainment for ozone and PM₁₀.

Two State of California regulations for asbestos control are applicable within El Dorado County and enforced by the EDCAQMD. These include (1) Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying and Surface Mining Operations (California Code of Regulations, Title 17, Section 93105) and (2) Asbestos Airborne Toxic Control Measure for Surfacing Applications (California Code of Regulations, Title 17, Section 93106).

Local Standards

Local air quality regulations are established and regulated by the EDCAQMD. The EDCAQMD Board of Directors adopted amended and new fugitive dust rules on July 19, 2005. These rules would be applicable to the proposed project and include:

- Rule 223 Fugitive Dust – General Requirements
- Rule 223-1 Fugitive Dust – Construction Requirements
- Rule 223-2 Fugitive Dust - Asbestos Hazard Mitigation (if certain conditions are found to be present, this rule may apply)

The EDCAQMD rules listed above regulate fugitive dust (including that potentially containing NOA) generated by construction activities and require appropriate mitigation measures to reduce air quality impacts. The project will also be subject to AQMD Rule 224, which prohibits the use of “cutback asphalt”, which is asphalt cement that has been liquefied by blending with petroleum solvents.

EDCAQMD’s Guide to Air Quality Assessment (2002) specifies specific daily emissions thresholds that can be used to determine the significance of project emissions. Thresholds of significance for specific pollutants of concern are as follows:

- ROG: 82 lbs/day
- NO_x: 82 lbs/day
- CO: AAQS
- PM₁₀: AAQS

4.3.2 Potential Environmental Effects

The project would result in short-term, temporary air pollutant emissions from construction activities. Several of the checklist responses and discussion provided below are dependent upon potential impacts associated with construction emissions. As such, a discussion of construction emissions estimates and significance is provided here to serve as the basis for discussion that follows. Construction emissions were estimated for the project using the Sacramento Air Quality Management District's *Road Construction Emissions Model, Version 5.1* as recommended in the EDCAQMD *Guide to Air Quality Assessment*. As shown in **Tables 4-2** and **4-3**, none of the criteria pollutants are anticipated to exceed the daily emissions thresholds and project-related construction emissions are therefore considered less than significant.

Project Phases	ROG (lbs/day)	CO (lbs/day)	NO _x (lbs/day)	PM ₁₀ (lbs/day)	<i>Exhaust</i> PM ₁₀ (lbs/day)	<i>Fugitive</i> Dust PM ₁₀ (lbs/day)
Grubbing/Land Clearing	8	33	35	9	2	8
Grading/Excavation	10	44	47	10	3	8
Drainage/Utilities/Sub-Grade	8	36	38	10	2	8
Paving	2	12	18	1	1	0
Maximum (pounds/day)	10	44	47	10	3	8
Significance Criteria	82	AAQS ¹	82	AAQS ¹	N/A	N/A
Significant	No	No ¹	No	No	N/A	N/A
Notes: ¹ As noted in the EDCAQMD CEQA Guide, CO and PM ₁₀ Total Average Daily Emissions are calculated in lbs/day when using the Roadway Construction Emissions Model and must be converted to ambient concentrations. See Table 4-3 for CO Concentration and Significance Determination. Data entered to emissions model: Project Start Year: 2009; Project Length (months): 3; Total Project Area (acres): 1.5; Total Soil Imported/Exported (yd ³ /day): 100. Miles per round trip for soil hauling activities: 30 miles; Number of round trips per day: 5. PM ₁₀ estimates assume 50% control of fugitive dust from watering and associated dust control measures. Total PM ₁₀ emissions are the sum of <i>exhaust</i> and <i>fugitive dust</i> emissions. Source: Emissions estimated using Sacramento Metropolitan Air Quality Management District's Road Construction Emissions Model, Version 5.1						

Concentration	1-Hour	8-Hour
Background Concentration	1.39	0.35
Project-Related Pollutant Concentration	1.1	1.1
Anticipated Total Concentration	2.49	1.45
Ambient Air Quality Standard ¹	20.0	9.0
Project Variance from AAQS	-17.51	-7.55
Significance Determination (Significant if project variance is positive)	No	No
¹ The Ambient Air Quality Standard referenced in the table above, is the California AAQS, as it is more stringent than the federal AAQS (35.0 ppm). Note: The above calculations assume project-related CO concentration levels associated with additional peak-hour trips are based on a conservative assumption that the project would result in 300 additional peak-hour trips during construction.		

Chapter 4 of the EDCAQMD *Guide to Air Quality Assessment* references that average daily construction emissions for CO and PM₁₀ must be converted from lbs/day to ambient concentrations for comparison to the AAQS. **Table 4-3** shows the calculations for CO concentrations resulting from project construction activities. Though the modeling techniques described in the EDCAQMD Guide are intended for operation emissions calculations, the above conversions were utilized to determine the project's construction-related CO emission concentrations, as recommended in the Guide. As discussed in Chapter 6 of the EDCAQMD Guide, PM₁₀ emissions associated with projects can be considered less than significant if the projects are below the established thresholds for ROG and NO_x emissions. Because ROG and NO_x emissions would be less than significant for the proposed project (as discussed above), it can be concluded that PM₁₀ emissions would also be less than significant and PM₁₀ conversion calculations were not evaluated.

- a) *Would the project conflict with or obstruct implementation of the applicable air quality plan?*

Less Than Significant. The proposed project would result in temporary emissions of particulate matter, carbon monoxide, reactive organic compounds (ROG), and nitrogen oxides (NO_x) during construction as a result of ground disturbance activities and the operation of construction vehicles and equipment. These impacts would be minimal due to the limited nature of the project and short-term construction period and have been determined less than significant based on the information presented above. These short-term construction emissions are, therefore, not anticipated to affect applicable air quality planning.

The proposed project is not capacity increasing (i.e., the project would improve roadway safety, but would not result in an increase in motor vehicle trips), and therefore would not result in increased operational air quality emissions. The project would not support increased use of the roadway, and any new long-term impacts to air quality are not expected. The project is consistent with all applicable air quality attainment plans.

- b) *Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?*

Less Than Significant. El Dorado County is in non-attainment status for both federal and state ozone standards and for the state PM₁₀ standard. Construction activities would result in short-term increases in emissions from the use of heavy equipment that generate dust, exhaust, and tire-wear emissions and from paints and coatings. As discussed above and presented in **Table 4-2**, project construction would create short-term increases in fugitive dust and both ROG and NO_x emissions from vehicle and equipment operation. Although the project area is designated non-attainment for PM₁₀ and ozone, the PM₁₀ and ozone precursor (ROG and NO_x) emissions estimated for the project have been determined to be less than significant based on EDCAQMD thresholds which have been developed in consideration of the region's air quality standards attainment status.

- c) *Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors)?*

Less than Significant. Refer to response b) above. While the project would generate short-term air quality impacts as a result of construction activities, because the proposed project does not involve new uses or an expansion of use along Latrobe Road, the proposed project would not result in long-term or cumulatively considerable increases in air quality pollutant emissions for which El Dorado County is currently in non-attainment (ozone precursors, NO_x and ROG, and PM₁₀). The project would not result in increased traffic or a long-term increase in air pollutant emissions. The methodology and impact significance criteria for review of project-specific impacts associated with construction emissions considers the existing air quality of the project area and, as such, determines impact significance based on cumulative air quality considerations. The air pollutant emissions increase associated with construction activities was determined to be less than significant and would result in less than significant contributions to cumulative pollutant increases in the region.

- d) *Would the project expose sensitive receptors to substantial pollutant concentrations?*

Less Than Significant. "Sensitive receptors" for air pollutants are considered residences, schools, parks, hospitals, or other land uses where children or the elderly

congregate, or where outdoor activity is the primary land use. The project area is primarily roadway with adjacent rural grasslands. The nearest schools are approximately 3.75 miles north-northeast of the project area (Blue Oak Elementary School and Camerado Springs School). Currently, the closest residence to the project area is located approximately 500 feet southwest of the project area. The adjacent residence has the potential to be exposed to pollutant concentrations. The proposed project could result in temporary emissions of particulate matter, carbon monoxide, ROG, and NO_x during construction as a result of ground disturbance activities and the operation of construction vehicles and equipment. These impacts would be less than significant due to the limited nature of the project and short-term construction period. No long-term mobile source air pollutant emissions are anticipated to create substantial localized air pollutant concentrations.

The proposed project area is located outside of areas identified on the most recent Naturally Occurring Asbestos Review Area Map as being “More Likely to Contain Asbestos” (July 22, 2005). Youngdahl Consulting Group, Inc. conducted an assessment for naturally occurring asbestos for the proposed project. Based on the Youngdahl assessment, there was no visible indication of NOA, and no NOA was detected in the samples collected from the project area. As discussed in **Section 3.4.7**, the proposed project would be required to comply with EDCAQMD Rules 223, 223-1, and 223-2 to minimize fugitive dust emissions and the potential for risk of disturbance to naturally occurring asbestos.

- e) *Would the project create objectionable odors affecting a substantial number of people?*

Less Than Significant. Construction activities would involve the use of a variety of gasoline or diesel powered equipment that emit exhaust fumes and asphalt paving which has a distinctive odor during application. These emissions would occur intermittently throughout the workday and the associated odors are expected to dissipate rapidly within the immediate vicinity of the work area. Persons within proximity to the construction work area may find these odors objectionable. However, the limited number of receptors, infrequency of the emissions, rapid dissipation of the exhaust into the air, and short-term nature of the construction activities would result in a less than significant impact associated with construction odors.

This page is intentionally blank.

4.4 Biological Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?		✓		
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?			✓	
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?		✓		
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?			✓	
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?			✓	
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?			✓	

4.4.1 Environmental Setting

The project area is located on Latrobe Road between Ryan Ranch Road and a private driveway in a rural residential area south of El Dorado Hills. The roadway realignment is through rolling hill terrain adjacent to rural residential properties in the form of large private parcels and ranches.

One channel and one swale were observed within the project study area. The channel has an ordinary high water mark (OHWM) of approximately 20 cm (8 in) and occurs near the center of the realignment length on the northeast side of Latrobe Road. It flows from an approximately 20 cm (8 in) culvert under Latrobe Road in a northeasterly direction to a larger channel located approximately 20 m (65 ft) northeast of the project study area, which is a tributary to Deer Creek. Deer Creek is located approximately 0.3-km (0.2-mi) southeast of the project area. The swale is located in the southern portion of the realignment. The swale does not have a defined bed and bank (no OHWM) and flows to the same offsite tributary to Deer Creek. The swale is not associated with a culvert. **Figure 3** depicts the location of Channel 1 and Swale 1.

A query of the California Natural Diversity Database (CNDDDB) was conducted for the Folsom SE, Latrobe, Clarksville and Shingle Springs USGS quadrangles. There were no biologically important areas in the project study area. The CNDDDB query identified the northern Pacific pond turtle (*Clemmys m. marmorata*) as the only special-status species within one mile of the project site. Tricolored blackbird (*Agelaius tricolor*), Swainson's hawk (*Buteo swainsoni*), Sanford's arrowhead (*Sagittaria sanfordii*), and Brandegeee's clarkia (*Clarkia bilboea ssp. Brandegeeeae*) were identified by the CNDDDB within 8 km (5 mi) of the project site (**Figure 4**). The USFWS list identified fifteen listed species and four candidate species within the County. There are no recorded occurrences of special-status species within the project area. Each of the species and habitats are listed in **Table 4-4**, which includes species that have been listed by the USFWS and/or CDFG in their lists as regional species and habitats of concern.

Table 4-4
Regional Species and Habitats of Concern

Scientific Name	Common Name	Status ¹	Habitat	Habitat Present	Rationale
HABITATS					
Waters of the U.S.				Yes	Regulated by USACE and CDFG
Riparian woodlands				No	Not within project study area
Oak woodlands				Yes	Protected by El Dorado County
Hardhead streams				No	Not within project study area
PLANTS					
<i>Senecio layneae</i>	Laynes ragwort	FT, CE	Chaparral, woodland, rocky serpentine and gabbro soils	No	No serpentine or gabbro soils onsite
<i>Calystegia stebbinsii</i>	Stebbin's morning-glory	FE, CE	Chaparral, woodland within rocky serpentine and gabbro soils	No	No serpentine or gabbro soils onsite
<i>Ceanothus roderickii</i>	Pine Hill ceanothus	FE	Chaparral, woodland within rocky serpentine and gabbro soils	No	No serpentine or gabbro soils onsite
<i>Fremontodendron californicum</i> ssp. <i>decumbens</i>	Pine Hill flannelbush	FE	Chaparral, woodland within rocky serpentine and gabbro soils	No	No serpentine or gabbro soils onsite
<i>Galium californicum</i> ssp. <i>sierrae</i>	El Dorado bedstraw	FE	woodland within rocky serpentine and gabbro soils	No	No serpentine or gabbro soils onsite
<i>Clarkia bilboea</i> ssp. <i>brandegeae</i>	Brandegee's clarkia	CNPS 1B	Chaparral, Cismontane woodlands, and roadcuts.	Possible	Suitable habitat present.
<i>Chlorogalum grandiflorum</i>	Red Hills soaproot	CNPS 1B	Chaparral, woodland within rocky serpentine and gabbro soils	No	No serpentine or gabbro soils onsite
<i>Eryngium pinnatisectum</i>	Tuolumne button-celery	CNPS 1B	Cismontane woodland, lower montane conifer forest, vernal pool/mesic	No	No vernal pool habitat onsite.
<i>Sagittaria sanfordii</i>	Sanford's arrowhead	CNPS 1B	Marshes and swamps	No	No habitat present onsite
<i>Rorippa subumbellata</i>	Tahoe yellow-cress	FC, CE	Montane coniferous forest, meadows and seeps	No	Project site is below elevational range
INVERTEBRATES					
<i>Lepidurus packardii</i>	Vernal pool tadpole shrimp	FE	Vernal pools	No	Lack of suitable habitat
<i>Branchinecta lynchi</i>	Vernal pool fairy shrimp	FT	Vernal pools	No	Lack of suitable habitat
<i>Desmocerus californicus dimorphus</i>	Valley elderberry longhorn beetle	FT	Elderberry shrubs	No	No elderberry shrubs within the project study area.

**Table 4-4
Regional Species and Habitats of Concern**

Scientific Name	Common Name	Status ¹	Habitat	Habitat Present	Rationale
FISHES					
<i>Oncorhynchus tshawytscha</i>	Winter-run chinook salmon	FE, CE	Sacramento River with clean, cold water, and gravel beds	No	Lack of suitable habitat
<i>Oncorhynchus tshawytscha</i>	Central Valley spring-run chinook salmon	FT	Sacramento River system	No	Lack of suitable habitat
<i>Oncorhynchus clarki henshawi</i>	Lahontan cutthroat trout	FT	High mountain streams and lakes	No	Lack of suitable habitat
<i>Oncorhynchus mykiss</i>	Central Valley steelhead	FT	Sac-San Joaquin rivers	No	Lack of suitable habitat
<i>Hypomesus transpacificus</i>	Delta smelt	FT, CT	Sac-San Joaquin Delta	No	Lack of suitable habitat
AMPHIBIANS					
<i>Rana aurora draytonii</i>	California red-legged frog	FT	Ponds, pools, wetlands	Possible	Potential upland or dispersal habitat due to proximity of Deer Creek and tributary stream, none observed
<i>Ambystoma californiense</i>	California tiger salamander	FT	seasonal pools and stockponds	No	Lack of suitable habitat
<i>Bufo canorus</i>	Yosemite toad	FC	High mountains from 2,430 m (8,000 ft) to 3,480 m (10,000 ft) elevation	No	Project site below elevational range
<i>Rana muscosa</i>	Mountain yellow-legged frog	FC,CSC	Found in lakes, ponds, marshes, meadows, and streams.	No	Project site below elevational range
<i>Rana boylei</i>	Foothill yellow-legged frog	CSC	Streams and rivers to 2,088 m (6,000 ft)	Possible	Potential habitat due to proximity of Deer Creek and tributary stream, none observed.
REPTILES					
<i>Clemmys m. marmorata</i>	Northern Pacific pond turtle	CSC	streams, marshes, ponds, usually north of San Francisco Bay	No	Lack of suitable habitat within the project study area.
<i>Thamnophis gigas</i>	Giant garter snake	FT, CT	Valley marshes and sloughs	No	Lack of suitable habitat
BIRDS					
<i>Buteo swainsoni</i>	Swainson's hawk	CT	Riparian, agriculture, grasslands	No	Lack of suitable nesting habitat within the project study area; potential nesting habitat on Deer Creek.
<i>Agelaius tricolor</i>	Tricolored blackbird	CSC	Marshes and blackberry thickets	No	Lack of suitable habitat

**Table 4-4
Regional Species and Habitats of Concern**

Scientific Name	Common Name	Status ¹	Habitat	Habitat Present	Rationale
MAMMALS					
<i>Martes pennanti</i>	Fisher	FC	Mature to climax conifer forests	No	Lack of suitable habitat

¹ Status:

FE = Federal Endangered	CE = California State Endangered
FT = Federal Threatened	CT = California State Threatened
FC = Federal Candidate	
CSC = California Species of Concern	

4.4.2 Potential Environmental Effects

- a) *Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?*

Less Than Significant With Mitigation Incorporation. The project area is located within the USGS 7.5' Folsom SE quadrangle, and according to the U.S. Fish and Wildlife Service (USFWS), several special status species have the potential to occur within the USGS 7.5' Folsom SE quadrangle (USFWS, 2008). Because the list covers an area much larger than that of the project and includes habitats that are not present within its boundaries, it can be said with certainty that several of the noted species do not occur within the project area. Examples include fish and amphibian species that require habitats not available within or immediately adjacent to the project area or invertebrates that require specific host plants not present within the project area.

Based on a records search of the CNDDDB and the USFWS list for the Folsom SE quadrangle and the surrounding quadrangles (conducted by Padre Associates biologists), several special-status plant and wildlife species have the potential to occur onsite or in the project vicinity. Field observations and literature review were conducted to determine the potential for these special-status species to occur within the project area. The studies conclude that one special-status plant species (Brandege's clarkia) has a low potential for occurrence within the study area, and none were observed during field surveys, which were conducted during the species' blooming period. Development of the proposed project is not anticipated to impact Brandege's clarkia; therefore, this impact is considered less than significant.

Two special-status wildlife species (California red-legged frog and Foothill yellow-legged frog) have a low potential to occur within the study area. Implementation of Mitigation Measure 1 would reduce this potentially significant impact to a less-than-significant level.

Construction activities within 0.4 km (0.25 mi) of an active nest site in urban areas or 0.8 km (0.5 mi) of an active nest site in rural areas could result in nest abandonment, which is considered a “take” by the California Department of Fish and Game. The project area is located in a rural area and has the potential to provide suitable Swainson’s hawk nesting habitat. The majority of the trees onsite are blue oak (*Quercus douglasii*), which do not offer optimal nesting habitat for Swainson’s hawks. Deer Creek, approximately 1,000 feet south of the project site, does contain riparian vegetation that would provide suitable nesting habitat for Swainson’s hawks. The project site is above Swainson’s hawk elevational preference for breeding in California. This species more commonly nests in the valley, but the project site is at the easternmost limits of Swainson’s hawk breeding range (CNDDDB, 2008) and Swainson’s hawk is known to breed on the lower reaches of Deer Creek. This species was not reported during other biological surveys in the vicinity of the project area (El Dorado Co, 1998, 2001, and 2002), and is not expected to occur within the project area; however, it could occur within 0.5 mile of the project area. Implementation of Mitigation Measure 2 would reduce this potentially significant impact to a less-than-significant level.

The trees, shrubs, and grasslands on the site provide suitable habitat for a number of common and special-status avian species protected solely by the Migratory Bird Treaty Act (MBTA). The MBTA prohibits the killing of migratory birds. Because the proposed project requires the removal of trees, the potential for project impacts to avian species is considered significant. Implementation of Mitigation Measure 3 would reduce this potentially significant impact to a less-than-significant level.

Mitigation Measure 1. The County shall implement the following measures to minimize impacts on Foothill yellow-legged frogs (FYLF) and California red-legged frogs (CRLF):

- Wetted channel segments, areas of riparian scrub, and other Environmentally Sensitive Areas within the project study area, but outside the construction impact area, shall be staked and flagged to avoid encroachment by equipment and construction crews. Environmentally Sensitive Areas within the construction impact area that can be avoided by equipment and crews shall also be staked and flagged to minimize effects of construction.
- A FYLF/CRLF survey of the project site 48 hours before the onset of work activities. If any life stage of the FYLF/CRLF is found, and these individuals are likely to be killed or injured by work activities, the approved biologist shall be allowed sufficient time to move them from the site before work

activities begin. The biologist shall relocate the FYLF/CRLFs the shortest distance possible to a location that contains suitable habitat and shall not be affected by activities associated with the proposed project.

- During project activities, all trash that may attract predators shall be properly contained, removed from the work site, and disposed of regularly. Following construction, all trash and construction debris shall be removed from work areas.
- All refueling, maintenance, and staging of equipment and vehicles shall occur at least 60 feet from channels or water bodies and not in a location from where a spill would drain directly toward aquatic habitat. The monitor shall ensure contamination of habitat does not occur during such operations. Prior to the onset of work, the County shall ensure that a plan is in place for prompt and effective response to any accidental spills. All workers shall be informed of the importance of preventing spills and of the appropriate measures to take should a spill occur.
- Portions of the project area that are temporarily impacted shall be revegetated with an assemblage of native vegetation suitable for the area. Locally collected plant materials shall be used to the extent practicable. Invasive, exotic plants shall be controlled to the maximum extent practicable. This measure shall be implemented in all areas disturbed by activities associated with the project, unless the County determines that it is not feasible or practical. (For example, an area disturbed by construction that would be used for future activities need not be revegetated.)
- The number of access routes, size of staging areas, and the total area of the activity shall be limited to the minimum necessary to achieve the project goal. Environmentally Sensitive Areas shall be established to confine access routes and construction areas to the minimum area necessary to complete construction, and minimize the impact to FYLF/CRLF habitat; this goal includes locating access routes and construction areas outside of wetlands and riparian areas to the maximum extent practicable.
- The County shall attempt to schedule work activities for times of the year when impacts to the FYLF/CRLF would be minimal. To control sedimentation during and after project implementation, the County and its contractors shall implement BMPs outlined in any authorizations or permits, issued under the authorities of the Clean Water Act that it receives for the specific project. If best management practices are ineffective, the County shall attempt to remedy the situation immediately.

- The monitoring biologist shall permanently remove any individuals of exotic species, such as bullfrogs, crayfish, and centrarchid fishes from the project area, to the maximum extent possible. The biologist shall be responsible for ensuring his or her activities are in compliance with the California Fish and Game Code.
- To ensure that diseases are not conveyed between work sites by the biologist, the fieldwork code of practice developed by the Declining Amphibian Populations Task Force shall be followed at all times.

Mitigation Measure 2. Pre-construction raptor nesting surveys shall be conducted prior to development of the site (if construction activities are initiated between March 1 and September 15) to determine if any Swainson's hawk nest trees occur within 0.8 km (0.5 mi) of the site. Based on the survey protocol developed by the Swainson's Hawk Technical Advisory Committee, at least two survey periods prior to the project's initiation are required, which must be conducted between sunrise and 12:00 p.m. and between 4:00 p.m. and sunset (CDFG, 2000). If active Swainson's hawk nests are identified within 0.8 km (0.5 mi) of the project area, mitigation shall include:

- Postpone project activities until after the young have fledged and are no longer dependent on the nest tree; or
- If it is not possible to postpone project activities that may cause nest abandonment within 0.8 km (0.5 mi) of the nest site, with the approval of CDFG, conduct intensive monitoring of the nest site. Monitoring shall be conducted by a CDFG-approved raptor biologist during construction. The biologist shall have authority to stop all construction activities if adverse effects to adults and nestlings are occurring.

Mitigation Measure 3. The following measures shall be implemented to reduce project impacts on bird species:

- Minimize removal of native vegetation by locating staging areas and access routes in previously disturbed areas;
- Removal of vegetation shall be conducted in the fall and winter (between September 15 and March 1) after fledging and before the initiation of breeding activities;
- Pre-construction bird surveys shall be performed in spring to determine the location of nest sites within the project area. A 30 m (100 ft) buffer zone shall be established between active passerine nests and the project area, and a 150 m (500 ft) buffer zone between active raptor nests and the project area, unless CDFG permits a reduced buffer zone based on nesting phenology and recommendation(s) of a biological monitor;
- Construction activities shall be confined to the BSA to minimize the effects on wildlife occurring adjacent to the project area. Construction equipment shall

be required to have functional mufflers and properly tuned and maintained in a manner to reduce noise levels.

- b) *Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?*

Less Than Significant. Sensitive habitats include those that are of special concern to resource agencies and those that are protected under CEQA, the California Fish and Game Code, or the Clean Water Act. Development of the proposed project would result in the loss of oak woodland habitat. Based on the cover type mapping, a loss of 0.38 acre of oak woodlands is anticipated. Development of the proposed project would require the removal of up to 32 oak trees. The oak trees proposed for removal vary from 8 inches in diameter to 77 inches in diameter.

Several El Dorado County General Plan policies promote the protection of native oak trees in the County and the County's recently adopted (May 6, 2008; effective July 5, 2008) Oak Woodland Management Plan (OWMP) which implements the General Plan oak woodland protection policies.

As stated in the OWMP:

“Public Road and Public Utility Projects Exempt from Policy 7.4.4.4 – Oak canopy removal necessary to complete County capital improvement projects are exempt from the canopy retention and replacement standards, when the new alignment is dependent on the existing alignment. This exemption applies to road widening and realignments which are necessary to increase capacity, to protect the public's health, and to improve the safe movement of people and goods in existing public road rights-of-way, as well as acquired rights-of-way necessary to complete the project. This exemption shall also apply to removal of oak canopy necessary to comply with the safety regulations of the Public Utilities Commission and necessary to maintain a safe operation of utility facilities. The County shall minimize, where feasible, the impacts to oaks through the design process and right-of-way acquisition for such projects.”

The proposed project is included as Project Number 73359 on the County Capital Improvement Program. The project is dependent upon the existing alignment along Latrobe Road and is necessary to protect the public's health and improve operational safety through the proposed corridor. In accordance with Policy 7.4.4.4, the proposed project is exempt from the canopy retention and replacement standards.

An extension of an existing cross culvert would be required to accommodate the roadway realignment. This proposed culvert would extend the existing culvert (located at station 16+75) by approximately 15 feet, resulting in a 0.0002 acre impact to the channel. A new cross culvert would be installed at station 20+25. There are no channels or swales mapped in this location, therefore, installation of this culvert would not impact an existing channel. No wetlands would be impacted by the project. Although the project would result in the loss of 0.0002 acre of potentially jurisdictional waters of the U.S., they have not been identified as riparian habitat or as a sensitive natural community. Because the County and its contractor would install fencing to protect all waters and wetlands adjacent to the construction zone that would not be filled as a result of the project and would implement best management practices (BMPs) to minimize erosion and reduce sediments from entering channels and wetlands, this impact is considered less than significant.

- c) *Would the project have a substantial adverse effect on federally protected wetlands, as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal wetlands, etc.), through direct removal, filling, hydrological interruption or other means?*

Less Than Significant With Mitigation Incorporation. The project area supports a total of 0.0003 acre of potentially jurisdictional waters of the U.S. Of the 0.0003 acre, approximately 0.0002 acre would be impacted by the development of the proposed project. These areas are potentially regulated by the Corps and/or CDFG. Additionally, these areas are protected under the El Dorado County General Plan. Implementation of **Mitigation Measure 4** would reduce the impact to waters of the U.S. and wetlands within the project area to less than significant.

Mitigation Measure 4. If the final project designs are able to avoid wetlands impacts resulting in project-related impacts to jurisdictional waters of the U.S. totaling less than 0.1 acre, a post notification letter shall be required for impacts to these features. The requirements of a post-construction notification letter are summarized below:

Army Corps of Engineers Post-Construction Notification

The project developer shall prepare a letter to notify the Corps of discharges causing the loss of 0.1 acre or less of waters of the U.S., resulting from the project (after project completion). This report shall be submitted within 30 days of completion of the work, to the District Engineer and shall contain the following information: (1) The name address and telephone number of the permittee; (2) the location of the work; (3) the type and acreage of the loss of waters of the U.S.; and (4) the type and acreage of any compensatory mitigation used to offset the loss of waters of the U.S.

- d) *Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?*

Less Than Significant. Deer Creek, approximately 1,000 feet from the project site, provides a good natural migration corridor within the riparian habitat on the creek. Deer Creek also provides a corridor within the area for seasonal migrations to higher and lower elevational areas in the region. However, there are no known wildlife corridors or native wildlife nursery sites within the project area. The roadway development associated with the project is not expected to affect the regular movement of wildlife through or adjacent to the project area.

- e) *Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?*

Less Than Significant. The Proposed project site contains scattered native oak trees that are protected under the El Dorado County General Plan and CEQA. It is anticipated that up to 32 oak trees would require removal in order to develop the proposed project. On May 6, 2008 (effective July 5, 2008), the County adopted the Oak Woodland Management Plan (OWMP) which implements the General Plan oak woodland protection policies. As stated in Policy 7.4.4.4:

“Public Road and Public Utility Projects Exempt from Policy 7.4.4.4 – Oak canopy removal necessary to complete County capital improvement projects are exempt from the canopy retention and replacement standards when the new alignment is dependent on the existing alignment. This exemption applies to road widening and realignments that are necessary to increase capacity, to protect the public’s health, and to improve the safe movement of people and goods in existing public road rights-of-way, as well as acquired rights-of-way necessary to complete the project.”

In accordance with Policy 7.4.4.4, the proposed project is exempt from the canopy retention and replacement standards.

- f) *Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional or state habitat conservation plan?*

Less Than Significant. There are no adopted Habitat Conservation Plans, Natural Community Conservation Plans which are applicable to the project area. The project would not affect implementation of the USFWS’s adopted recovery plans for California Red-legged Frog or gabbro soils plants, both of which apply to portions of El Dorado County. Though the proposed project is located within the Sierra Nevada Foothills and Central Valley Recovery Unit identified in the USFWS Recovery Plan for the California Red-legged Frog, the project area lacks water features that could potentially provide suitable habitat; however, Deer Creek and its tributary are in close proximity to the project area. The proposed project would be developed in accordance with the requirements of the USFWS; therefore, the proposed project would not conflict with the provisions of the California Red-legged Frog Recovery

Plan. The project area is outside of the identified boundaries of the Pine Hill formation as identified in the Recovery Plan for Gabbro Soil Plants of the Central Sierra Nevada Foothills; therefore, this impact is considered less than significant.

4.5 Cultural Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?		✓		
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?		✓		
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?				✓
d) Disturb any human remains, including those interred outside of formal cemeteries?			✓	

4.5.1 Environmental Setting

In July 2008, Peak & Associates conducted complete field survey of the area of potential effects (APE). A record search was conducted through the North Central California Information Center of the California Historical Resources Information System on June 26, 2008 for the project area and a ¼-mile radius around the project area. In addition, records and maps of previously recorded prehistoric and historic sites were reviewed, as well as maps of previous cultural resources surveys in the region. In the APE, there are no previously recorded archaeological resources.

A letter was sent to the Native American Heritage Commission (NAHC) requesting a check of the Sacred Lands files. The reply from the NAHC on June 25, 2008 reported that there were no resources listed for the APE. Peak & Associates sent consultation letters to the Native American contacts provided by the NAHC.

4.5.2 Potential Environmental Effects

- a) *Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?*

Less Than Significant with Mitigation Incorporation. Based on the July 2008 archaeological evaluations of the project area, no known historic resources are located within the proposed project area. However, there is always the potential to disturb unknown cultural resources during construction activities. Implementation of **Mitigation Measure 5** would ensure that the proposed project would result in a less than significant impact to prehistoric and historic resources.

Mitigation Measure 5. Any and all potential archaeological resources discovered during construction shall be examined by a qualified archaeologist, who shall examine the findings, assess their significance, and offer recommendations for appropriate handling procedures. Work within 100 feet of the find shall cease.

In the event that unanticipated cultural or paleontological resources (including structural features, unusual amounts of bone or shell, artifacts, human remains, or architectural remains) are encountered during construction, all earthmoving activity shall cease until the developer retains the services of a qualified archaeologist. The archaeologist or paleontologist shall examine the findings, assess their significance, and offer recommendations for procedures deemed appropriate to either further investigate or mitigate adverse impacts to those cultural or paleontological archaeological resources that have been encountered (e.g., excavate the significant resource).

- b) *Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?*

Less Than Significant with Mitigation Incorporation. Based on the July 2008 archaeological evaluations of the project area, no known prehistoric resources are located within the proposed project area. There is always the potential to disturb unknown cultural resources during construction activities; therefore, implementation of **Mitigation Measure 5** would ensure that the proposed project would result in a less than significant impact to prehistoric and historic resources.

- c) *Would the project directly or indirectly destroy a unique paleontological resource or site or unique geological feature?*

No Impact. According to the El Dorado County General Plan Environmental Impact Report (Pages 2-69 and 2-70 of Volume 4a), paleontological resources in El Dorado County are associated with limestone cave deposits, occurrences of the Mehrten formation, and Pleistocene channel deposits. Since the project does not occur in areas supporting any of these formations, construction is not expected to affect any paleontological resources. The site also does not contain any other unique geologic features.

- d) *Would the project disturb any human remains, including those interred outside of formal cemeteries?*

Less Than Significant. It is not anticipated that any human remains would be encountered during construction of the proposed project; however, the proposed project would be subject to the provisions of the California Health and Safety Code Section 7050.5 and California Public Resources Code Section 5097.94 et seq., regarding the discovery and disturbance of human remains should any human remains be discovered during project construction. Therefore, potential impacts from the proposed project are considered less than significant.

This page is intentionally blank.

4.6 Geology and Soils

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.				✓
ii) Strong seismic ground shaking?			✓	
iii) Seismic-related ground failure, including liquefaction?				✓
iv) Landslides?				✓
b) Result in substantial soil erosion or the loss of topsoil?			✓	
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?			✓	
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?				✓
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?			✓	

4.6.1 Environmental Setting

Regional Geology

El Dorado County is located in the Sierra Nevada geomorphic province of California, which is east of the Great Valley province and west of the Range and Basin provinces. The Sierra Nevada province is characterized by steep-sided hills and narrow, rocky stream channels. This province consists of Pliocene and older deposits that have been uplifted as a result of plate tectonics, granitic intrusion, and volcanic activity. Subsequent glaciation and additional volcanic activity are factors that led to the east-west orientation of stream channels (El Dorado County General Plan Draft EIR, 2003).

The southwestern foothills of El Dorado County are composed of rocks of the Mariposa Formation that include amphibolite, serpentine, and pyroxenite. The northwestern areas of the county consist of the Calaveras Formation, which includes metamorphic rock such as chert, slate, quartzite, and mica schist. In addition, limited serpentine formations are located in this area. The higher peaks in the County consist primarily of igneous and metamorphic rocks with granite intrusions, a main soil parent material at the higher elevations (El Dorado County General Plan Draft EIR, 2003).

Seismicity

Seismicity is defined as the geographic and historical distribution of earthquake activity. Seismic activity may result in geologic and seismic hazards including seismically induced fault displacement and rupture, ground shaking, liquefaction, lateral spreading, landslides and avalanches, and structural hazards. Based on historical seismic activity and fault and seismic hazards mapping, El Dorado County is considered to have relatively low potential for seismic activity, and is located beyond the highly active fault zones of the coastal areas of California. The County's fault systems and associated seismic hazards are described below (El Dorado County General Plan Draft EIR, 2003).

Fault Systems

Earthquake activity is intrinsically related to the distribution of fault systems (i.e., faults or fault zones) in a particular area. The distribution of known faults in El Dorado County is concentrated in the western portion of the county, with several isolated faults in the central county area and the Lake Tahoe Basin. Fault systems mapped in western El Dorado County include the West Bear Mountains Fault; the East Bear Mountains Fault; the Maidu Fault Zone; the El Dorado Fault; the Melones Fault Zone of the Clark, Gillis Hill Fault; and the Calaveras–Shoo Fly Thrust. No active faults have been identified in El Dorado County. One fault, part of the Rescue Lineament–Bear Mountains fault zone, is classified as a well located late-Quaternary fault; therefore, it represents the only potentially active fault in the County. It is part of the Foothill Fault Suture Zone system, which was considered inactive until a Richter scale magnitude 5.7 earthquake occurred near Oroville on August 1, 1975. All other faults located in El Dorado County are classified as pre-Quaternary (inactive) (El Dorado County General Plan Draft EIR, 2003).

Soils

The USDA Soil Conservation Service “Soil Survey of El Dorado Area, California” (1974) depicts the site as covered by Auburn Series soils (Auburn very rocky silt loam, 2 to 30 percent slopes [AxD] and Auburn very rocky silt loam, 30 to 50 percent slopes [AxE]), which typically are comprised of 14 to 27 inches of surficial clayey silt or sandy silt, underlain by hard metamorphic rock. Both soil types are well drained.

4.6.2 Potential Environmental Effects

a) *Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death, involving:*

i) *Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?*

No Impact. El Dorado County does not contain any earthquake faults as identified on the most recent Alquist-Priolo Earthquake Fault Zoning Map(s); therefore, there would be no potential impact of the project to expose people and/or structures to fault rupture hazards.

ii) *Strong seismic ground shaking?*

Less than Significant. The project is not located in an area subject to seismic ground shaking or seismic-related ground failure and is not subject to landslides, seismic-related or otherwise. The project area does not include any structures or dwellings that would be a high risk of collapse during a seismic event. The risk of adverse effects from ground shaking is considered to be less than significant.

iii) *Seismic-related ground failure, including liquefaction?*

No Impact. Liquefaction is most likely to occur in deposits of water-saturated alluvium or similar deposits of artificial fill. No areas of this type have been identified in El Dorado County; therefore, no impacts due to liquefaction are anticipated.

iv) *Landslides?*

No Impact. The slope south of Latrobe Road would be excavated and stabilized to reduce the potential for slope runoff, erosion and sloughing of material; therefore, the likelihood of landslides is minimal and no impacts are anticipated.

b) *Would the project result in substantial soil erosion or the loss of topsoil?*

Less Than Significant. The project would require grading of approximately 2 acres which, if completed without the application of standard Best Management Practices, could result in a condition that might be susceptible to stormwater-related erosion. However, all construction would be consistent with the requirements of the County's Grading Ordinance and Storm Water Management Plan for Western El Dorado County. DOT or its contractor will prepare a construction-related Storm Water Pollution Prevention Plan (SWPPP), consistent with Section 402 of the Clean Water Act and construction activities will include implementation of stormwater runoff BMPs identified with the SWPPP. Application of these requirements and measures would prevent substantial erosion or topsoil loss. Following construction, all disturbed areas not paved would be revegetated consistent with measures to be identified within the SWPPP to ensure the long-term minimization of erosion and topsoil loss potential.

c) *Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?*

Less Than Significant. Soils in the project area include Auburn very rocky silt loam, 2 to 30 percent slopes (AxD) and Auburn very rocky silt loam, 30 to 50 percent slopes (AxE). The Auburn soils have a low shrink-swell potential. Soil types within the project area are not susceptible to landsliding, lateral spreading, subsidence, liquefaction, or collapse. The project is also not located on a geologic unit known to be unstable and susceptible to landsliding, lateral spreading, subsidence, liquefaction, or collapse.

d) *Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?*

No Impact. Expansive soils are soils that increase in volume when they absorb water and shrink when they dry out. When buildings are placed on expansive soils, foundations may rise during each wet season and fall during each dry season. This movement may result in cracking foundations, distortion of structures, and warping of doors and windows, which may result in structural hazards. Roadway improvements at the project site would include the modification of the soil immediately below any roadway improvements. As discussed above, the Auburn series soils have a low shrink-swell potential. Further, construction of the improvements would include the addition of an aggregate base below the road

surface that would reduce potential impacts from soil expansion and contraction. Therefore, no impact associated with expansive soils is anticipated.

- e) *Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?*

Less Than Significant. Neither septic tanks nor alternative wastewater disposal systems are part of the proposed project. This impact is considered less than significant.

This page is intentionally blank.

4.7 Hazards and Hazardous Materials

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			✓	
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?			✓	
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?				✓
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?				✓
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?				✓
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?				✓
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?			✓	
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?				✓

4.7.1 Environmental Setting

A material is considered hazardous if it appears on a list of hazardous materials prepared by a Federal, State, or local agency, or if it has characteristics defined as hazardous by such an agency. A hazardous material is defined in Title 22 of the California Code of Regulations (CCR) as follows:

A substance or combination of substances which, because of its quantity, concentration, or physical, chemical or infectious characteristics, may either (1) cause, or significantly contribute to, an increase in mortality or an increase in serious irreversible, or incapacitating reversible, illness; or (2) pose a substantial present or potential hazard to human health or environment when improperly treated, stored, transported or disposed of or otherwise managed. (California Code of Regulations, Title 22, Section 66261.10)

Chemical and physical properties cause a substance to be considered hazardous. Such properties include toxicity, ignitability, corrosivity, and reactivity. CCR, Title 22, Sections 66261.20-66261.24 define the aforementioned properties. The release of hazardous materials into the environment could potentially contaminate soils, surface water, and groundwater supplies.

Under Government Code Section 65962.5, the California Department of Toxic Substances Control (DTSC) maintains a list of hazardous substance sites. This list, referred to as the "Cortese List", includes CALSITE hazardous material sites, sites with leaking underground storage tanks, and landfills with evidence of groundwater contamination. In addition, the El Dorado County Environmental Management Department maintains records of toxic or hazardous material incidents, and the Central Valley Regional Water Quality Control Board (RWQCB) keeps files on hazardous material sites.

Most hazardous materials regulation and enforcement in El Dorado County is overseen by the El Dorado County Environmental Management Department which refers large cases of hazardous materials contamination or violations to the Central Valley RWQCB and the State Department of Toxic Substances Control (DTSC). Other agencies, such as the El Dorado County AQMD and the Federal and State Occupational Safety and Health Administrations (OSHA), may also be involved when issues related to hazardous materials arise.

4.7.2 Potential Environmental Effects

- a) *Would the project create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials?*

Less Than Significant. Small amounts of hazardous materials would be used during construction activities (i.e., equipment maintenance, fuel, solvents, roadway resurfacing and striping materials). Hazardous materials would only be used during construction of the project, and any hazardous material uses would be required to comply with all applicable local, state and federal standards associated with the handling and storage of hazardous materials. Therefore, this impact is considered less than significant.

- b) *Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?*

Less Than Significant. The proposed project would result in a less than significant impact associated with the use and potential accidental release of hazardous materials during construction (see discussion at item “a”, above).

- c) *Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances or waste within one-quarter mile of an existing or proposed school?*

No Impact. Blue Oak Elementary School and Camerado Springs School are located approximately 3.75 miles north-northeast of the project area. As noted above, the project would involve the handling of hazardous materials; however, handling and storage of hazardous materials would comply with all applicable local, state, and federal standards. Furthermore, because the type and level of use is not expected to change, the project is also not expected to result in long-term vehicle-related emissions that may be hazardous (see the air quality discussion regarding vehicular emissions).

- d) *Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?*

No Impact. The project area does not include any sites which were included on a list of hazardous materials sites as maintained by the DTSC.

- e) *For a project located within an airport land use plan area or, where such a plan has not been adopted, within two miles of a public airport or a public use airport, would the project result in a safety hazard for people residing or working in the project area?*

No Impact. The project is not located within an Airport Land Use Plan area or in the vicinity of an airport. The nearest airport to the project area is the Cameron Park Airport located approximately 5.75 miles north-northeast of the project area.

- f) *For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?*

No Impact. The project is not located within the vicinity of a private airstrip.

- g) *Would the project impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan?*

Less Than Significant. The proposed project involves the realignment of Latrobe Road and may require temporary lane closures and traffic lane diversions to enable construction activities to proceed safely. The County anticipates that construction of the proposed project would require the construction contractor to close traffic in one direction while construction activities were occurring. Diversions of traffic would be signed; and barriers, striping, and cones would be used as necessary to guide traffic and delineate temporary lanes. Flagpersons would monitor and guide traffic during periods of equipment movement or when construction activities were occurring near traffic lanes to ensure public and worker safety. Project construction activities would be coordinated with local law enforcement and emergency services providers. As a result of this coordination, law enforcement and emergency service providers would be aware of project construction and the potential for any emergency vehicle movement delays within the project area and measures to avoid such delays would be determined. The proposed project construction would not affect the provision of emergency services in and adjacent to the project area or evacuation in the event of a major emergency. This impact is considered less than significant.

- h) *Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?*

No Impact. According to the California Fire Alliance's Fire Planning and Mapping Tools database, the project is in an area dominated by fuels classified as "high" to "very high" in terms of wildland fire risk (<http://wildfire.cr.usgs.gov/fireplanning>), accessed April 10, 2008). However, because the project involves placement of impervious surface and would not introduce a fuel source, project construction and operation is not anticipated to result in a new or increased exposure of people or structures to a significant risk of loss, injury or death involving wildland fires.

4.8 Hydrology and Water Quality

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project:				
a) Violate any water quality standards or waste discharge requirements?			✓	
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?				✓
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?			✓	
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?			✓	
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?			✓	
f) Otherwise substantially degrade water quality?				✓
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?				✓
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?				✓
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?				✓
j) Inundation by seiche, tsunami, or mudflow?				✓

4.8.1 Environmental Setting

The proposed project area is located in the unincorporated community of Latrobe in El Dorado County. The project is located within the 1,265-square mile Cosumnes River watershed, which encompasses the southern region of El Dorado County, extending from its headwaters at the Iron Mountain Ridge in the Sierra Nevada, west to its confluences with the Sacramento River in Sacramento County (El Dorado County, 1998).

A tributary to Deer Creek runs parallel to the east side of Latrobe Road within the project area.

According to the Federal Emergency Management Agency (FEMA) Map, (Community Panel Number: 06017C0950E, Effective Date September 26, 2008, the project area is located in an area determined to be outside of the 0.2 percent annual chance floodplain (Zone X).

4.8.2 Potential Environmental Effects

- a) *Would the project violate any water quality standards or waste discharge requirements?*

Less Than Significant. The project would be subject to the National Pollutant Discharge Elimination System (NPDES) permit, which requires the use of Best Management Practices (BMPs), as outlined in the *Storm Water Management Plan for Western El Dorado County (SWMP)*, to minimize water quality impacts from construction projects. The County would obtain coverage for the project under the Statewide General Permit for Discharges of Storm Water Associated with Construction Activity, Order No. 99-08 DWQ. In accordance with the provisions of the General Permit and the SWMP, the County would require the contractor to prepare and implement a Storm Water Pollution Prevention Plan (SWPPP) to reduce or minimize discharge of pollutants from construction activities.

Due to the implementation of BMPs as required by El Dorado County and the NPDES permit, construction activities associated with the project would result in less than significant impacts to water quality.

- b) *Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?*

No Impact. The project would not affect the current function of the fractured rock aquifer groundwater systems in the area, including movement within the aquifers and recharge.

- c) *Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner, which would result in substantial erosion or siltation on- or off-site?*

Less Than Significant. The proposed project would result in the addition of approximately 0.4 acres (17,424 square feet) of impervious surface in the form of realigned and widened roadway surface. The stormwater runoff associated with the increase in impervious surface within the project area would be accommodated by the existing drainage system and addition of a new drainage system that would not result in an increase of erosion or siltation within the project vicinity. As such, the project would result in less than significant impacts associated with erosion and siltation.

- d) *Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site?*

Less Than Significant. The proposed roadway would be widened on both the east and west sides. Water flowing to the east side would continue to sheet flow off of the road. Water flowing to the west side would be retained along a new curb instead of an existing earthen ditch and flow into a new or an existing inlet and cross culverts. Both the new 18-inch culvert and the existing cross culvert would have rip rap installed for energy dissipation to minimize erosion. . The project would result in the addition of 0.4 acres (17,424 square feet) of impervious surface in the form of realigned roadway surface. The increase in impervious surface within the project area would not substantially alter the drainage pattern within the project area. Therefore, the proposed project would not result in substantial increases in runoff to the extent that the existing drainage system within the project area would be adversely affected and/or would operate inefficiently as to cause flooding on- or off-site. Therefore, this impact is considered less than significant.

- e) *Would the project create or contribute runoff water, which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?*

Less Than Significant. The proposed project would result in a net increase of approximately 0.4 acres (17,424 square feet) of impervious surface. The additional impervious surface is not expected to contribute to a substantial increase in water runoff from the site (see additional discussion at item “d”, above). Therefore, the project would have a less than significant contribution to the amount and quality of stormwater flows in the area.

- f) *Would the project otherwise substantially degrade water quality?*

No Impact. No additional impacts other than those discussed under c) and e) above are anticipated.

- g) *Would the project place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?*

No Impact. The proposed project is a roadway improvement project and no housing development is associated with the project.

- h) *Would the project place within a 100-year flood hazard area structures that would impede or redirect flood flows?*

No Impact. The project is not located within or adjacent to any dams, levees, or mapped 100-year floodplains. The nearest 100-year floodplain is located approximately 0.2 mile southeast of the project area. The project would provide sufficient stormwater runoff facilities so as not to impede or redirect stormwater flows.

- i) *Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of a failure of a levee or dam?*

No Impact. The project is not located within or adjacent to any dams, levees, or mapped 100-year floodplains.

- j) *Would the project be subject to inundation by seiche, tsunami or mudflow?*

No Impact. The proposed project would not create an additional risk from seiche or tsunami in the project area and the relatively flat topography eliminates the potential for mudslides to inundate the project site.

4.9 Land Use and Planning

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project:				
a) Physically divide an established community?				✓
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?			✓	
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?			✓	

4.9.1 Environmental Setting

The primary applicable land use plan within the project area is the 2004 El Dorado County General Plan. The El Dorado County General Plan policies are applicable to the Proposed project area.

4.9.2 Potential Environmental Effects

a) *Would the project physically divide an established community?*

No Impact. The project involves realignment and widening of approximately 1,600 feet of Latrobe Road. The areas surrounding the project area consist of annual grasslands, scattered oak trees and a single residence south of the project area. The existing and proposed roadway alignments would not divide an established community. The proposed project would not divide the surrounding community.

b) *Would the project conflict with any applicable land use plan, policy or regulation of an agency with jurisdiction over the project (including, but not limited to, the general plan, specific plan, local coastal program or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?*

Less Than Significant. The project would not conflict with any 2004 General Plan goals, policies or objectives intended to mitigate potential environmental effects (refer to the responses to 4.4(e) above and 4.15(b) below). Project design and

implementation of the project-specific mitigation measures identified within this MND would ensure the proposed project would not conflict with 2004 General Plan goals, policies and/or objectives. This impact is considered less than significant.

- c) *Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?*

Less Than Significant. As noted above under the response to 4.4(f), there are no adopted Habitat Conservation Plans or Natural Community Conservation Plans that apply to the project area. The project would not affect implementation of the USFWS' adopted recovery plans for California Red-legged Frog or gabbro soils plants, both of which apply to portions of El Dorado County. Though the proposed project is located within the Sierra Nevada Foothills and Central Valley Recovery Unit identified in the USFWS Recovery Plan for the California Red-legged Frog, the project area lacks water features that could potentially provide suitable habitat; however, Deer Creek and its tributary are in close proximity to the project area. The proposed project would be developed in accordance with the requirements of the USFWS; therefore, the proposed project would not conflict with the provisions of the California Red-legged Frog Recovery Plan. The project area is outside of the identified boundaries of the Pine Hill formation as identified in the Recovery Plan for Gabbro Soil Plants of the Central Sierra Nevada Foothills; therefore, this impact is considered less than significant.

4.10 Mineral Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?				✓
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?				✓

4.10.1 Environmental Setting

El Dorado County is considered a mining region capable of producing a wide variety of mineral resources. Metallic mineral deposits, gold in particular, are considered the most significant extractive mineral resources. No mineral extraction activities occur within or in the vicinity of the project site.

4.10.2 Potential Environmental Effects

- a) *Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?*

No Impact. The project is not within or adjacent to any important mineral resource areas as identified by the State of California; therefore, the proposed project would not impact the availability of mineral resources that would be of value to the state.

- b) *Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?*

No Impact. The project is not within or adjacent to any important mineral resource areas as identified by El Dorado County (2004 El Dorado County General Plan Figure CO-1); therefore, the proposed project would not impact the availability of mineral resources that would be of value to the region.

This page is intentionally blank.

4.11 Noise

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project result in:				
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?			✓	
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?			✓	
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?			✓	
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?			✓	
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?				✓
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?				✓

4.11.1 Environmental Setting

Of the existing noise sources in the area, the most prominent is vehicular traffic along Latrobe Road. The El Dorado County Draft EIR (2003) identifies that future conditions along Latrobe Road may expose noise-sensitive land uses adjacent to the roadway to noise levels that exceed the applicable standards. Baseline conditions calculated in 2001 (provided in the El Dorado County Draft EIR [2003]) indicate that noise levels are approximately 65.79 dBA 50 feet from the existing roadway centerline within the project area. These existing conditions exceed the applicable standards for noise levels for residential uses.

County General Plan Policy 6.5.1.11 outlines standards for daytime construction and would apply to construction-related noise associated with the project. General Plan Policy 6.5.1.11 notes that nighttime construction activities are allowed if it can be shown that nighttime construction activities would alleviate traffic congestion and safety hazards.

The significance of potential noise impacts associated with operation of transportation facilities is normally measured using General Plan Policy 6.5.1.12, which takes into account the existing (ambient) noise environment. However, because the project would not result in an increase of the number of vehicles passing through the roadway corridor, the ambient condition is not expected to change as a result of the project.

4.11.2 Potential Environmental Effects

- a) *Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance or of applicable standards of other agencies?*

Construction-related Noise

Less Than Significant. Construction activities could increase noise levels temporarily in the vicinity of the project. Actual noise levels would depend on the type of construction equipment involved, distance to the source of the noise, time of day, and similar factors. However, these increases would be temporary. Daytime construction activity would comply with noise standards for construction activities outlined in General Plan Policy 6.5.1.11, and any nighttime work would be allowed if nighttime construction activities would alleviate traffic congestion and safety hazards. Given that the project contractor would adhere to applicable County construction-related noise standards, this impact is considered less than significant.

Traffic-related Noise

Less than Significant. The proposed project would not generate increased traffic through the project area and would result in a realignment of the roadway approximately 10 feet south of the current alignment. j.c. brennan & associates, Inc. (JCB) estimated the change in project noise levels based on the Federal Highway Administration (FHWA) Highway Traffic Noise Prediction Model. JCB's modeling indicated that the proposed project would result in a 1.1 dB increase in the average noise level. The estimated increase in noise levels is within 1.5 dB threshold increase established by General Plan Policy 6.5.1.12. The 10-foot realignment of the roadway and the absence of increased traffic generation associated with the project is anticipated to result in less than significant traffic-related noise.

- b) *Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?*

Less Than Significant. Project construction includes activities, such as operation of large pieces of equipment (e.g., heavy trucks), which may result in the periodic, temporary generation of groundborne vibration. Because the project would not expand the roadway or change the way in which it is used, an increase in groundborne vibration associated with use of the road would not change from the current condition. Given the nature of any potential groundborne vibration and given that any impacts would be temporary and periodic, potential impacts are less than significant.

- c) *Would the project result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?*

Less Than Significant. Because the project is not traffic-inducing or growth-inducing and would not change the way in which the roadway is used, the proposed project would not contribute to a substantial permanent increase in the ambient noise level in the project vicinity.

- d) *Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?*

Less Than Significant. Construction activities would increase noise levels temporarily in the vicinity of the project. Actual noise levels would depend on the type of construction equipment involved, distance to the source of the noise, weather, time of day, and other factors. However, these increases would be temporary. Daytime construction activity would comply with noise standards for construction activities outlined in General Plan Policy 6.5.1.11, and any nighttime work would be allowed if nighttime construction activities would alleviate traffic congestion and safety hazards. Because the project contractor would be required to comply with applicable County construction-related noise standards, this impact is considered less than significant.

- e) *For a project located within an airport land use plan area or, where such a plan has not been adopted, within two miles of a public airport or a public use airport, would the project expose people residing or working in the project area to excessive noise levels?*

No Impact. The project area is not located within an airport land use plan area nor is it located within two miles of a public airport. With the exception of temporary construction noise, discussed above, the proposed project would not result in a change in noise exposure for people residing or working within the project area.

- f) *For a project located within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?*

No Impact. The project is not located within the vicinity of a private airstrip.

This page is intentionally blank.

4.12 Population and Housing

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?				✓
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?				✓
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?				✓

4.12.1 Environmental Setting

The project area consists primarily of annual grasslands with scattered native oak trees north and south of the existing roadway segment. The lands surrounding the project area are zoned for residential agriculture (RA-40 and RA-80). The nearest residence to the project area is located approximately 500 feet southwest of the project area.

4.12.2 Potential Environmental Effects

- a) *Would the project induce substantial population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)?*

Less Than Significant. The project does not propose construction or replacement of new homes or businesses, would not affect the current distribution of homes and businesses, and does not propose extension of infrastructure that could support substantial population growth.

- b) *Would the project displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?*

No Impact. The project does not involve the displacement of any housing.

- c) *Would the project displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?*

No Impact. The project does not involve the displacement of people.

4.13 Public Services

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
Fire protection?				✓
Police protection?				✓
Schools?				✓
Parks?				✓
Other public facilities?				✓

4.13.1 Environmental Setting

General public safety and law enforcement services for the project area are provided by the El Dorado County Sheriff. The Latrobe Fire Protection District provides fire protection services and emergency services to the project area. The nearest fire station is located approximately 0.75 mile southeast of the project area.

4.13.2 Potential Environmental Effects

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:

a) *Fire protection?*

No Impact. The proposed project would not include elements that would increase human presence in the area; therefore, there would be no need for additional governmental facilities to provide fire protection.

b) *Police protection?*

No Impact. The proposed project would not include elements that would increase human presence in the area; therefore, there would be no need for additional governmental facilities to provide police protection.

c) *Schools?*

No Impact. The proposed project would not include elements that would increase population in the area and would not result in an increased demand for schools.

d) *Parks?*

No Impact. The proposed project would not include elements that would increase human presence in the area; therefore, the project would not result in an increased demand for parks or governmental facilities to maintain parks.

e) *Other public facilities?*

No Impact. The proposed project would not include residential or commercial components that would result in increased human presence in the area; therefore, the project would have no impact on other public facilities.

4.14 Recreation

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?				✓
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?				✓

4.14.1 Environmental Setting

There are no recreation facilities within or adjacent to the proposed project area. The nearest park is Creekside Greens Park, located approximately 3.3 miles northwest of the project area.

4.14.2 Potential Environmental Effects

- a) *Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?*

No Impact. The project would not increase the use of existing parks in the area and does not include the construction of any recreational facilities.

- b) *Does the project include recreational facilities, or require the construction or expansion of existing facilities, which might have an adverse physical effect on the environment?*

No Impact. The project does not include the construction of any recreational facilities and would not require the expansion of existing recreational facilities.

This page is intentionally blank.

4.15 Transportation/Traffic

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project:				
a) Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?				✓
b) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?				✓
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?				✓
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?			✓	
e) Result in inadequate emergency access?			✓	
f) Result in inadequate parking capacity?				✓
g) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?			✓	

4.15.1 Environmental Setting

The circulation systems for El Dorado County consist of a roadway network that until recently was primarily rural in character, but is rapidly urbanizing in the western portion of the County. U.S. 50 is the primary east-west transportation corridor connecting the County's major population centers. Other State highways, County arterials, and a network of local public and private roads constitute the remainder of the roadway system. Considered a key county road in the County General Plan Draft EIR (2003), Latrobe

Road is an integral component of the County roadway system, serving as a transportation arterial carrying traffic.

Currently, there are no transit facilities (e.g., bus turnouts) or bicycle facilities within the project area.

4.15.2 Potential Environmental Effects

- a) *Would the project cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume-to-capacity ratio on roads, or congestion at intersections)?*

No Impact. Because the project involves realignment of the project roadway but not a traffic-inducing or growth-inducing expansion of the existing roadway, the project would not result in an increase in traffic. Because no trip-generating land uses are associated with the project, the project would not result in substantial increases in traffic in or near the project area.

- b) *Would the project exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?*

No Impact. Because the project involves realignment of the project roadway but not a traffic-inducing or growth-inducing expansion of the existing roadway, it is not expected to exceed a level of service standard established by the County. Because no trip-generating land uses are associated with the project, the project would not result in substantial increases in traffic in or near the project area.

- c) *Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?*

No Impact. The proposed project would not result in a change in air traffic patterns or increase traffic levels that would result in a substantial safety risk. Therefore, no impacts on air traffic patterns would occur as a result of this project.

- d) *Would the project substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?*

Less Than Significant (Beneficial). The project includes features intended to improve safety of the existing roadway. The project would not include design features such as sharp curves, dangerous intersections, or turning radii that would increase hazards. Because uses of the roadway and surrounding areas would not change, it would likewise not result in any use incompatibility. Because the project

would realign the project roadway to reduce the risk of roadway hazards, this impact is considered beneficial.

- e) *Would the project result in inadequate emergency access?*

Less Than Significant. The project contractor would be required to prepare a Traffic Management Plan for construction activities to ensure adequate access for emergency vehicles during project construction. Following construction, the project would result in improved safety and operation on Latrobe Road which would be anticipated to result in a long-term improvement to emergency vehicle movement within the project area.

- f) *Would the project result in inadequate parking capacity?*

No Impact. Parking along Latrobe Road within the project area is prohibited; therefore, the proposed project would not impact on-street parking capacity.

- g) *Would the project conflict with adopted policies, plans or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?*

Less Than Significant. There are no transit facilities (e.g., bus turnouts) or bicycle facilities within the project area. The 2005 El Dorado County Bicycle Transportation Plan proposes Class 2 bicycle facilities along Latrobe Road within the project area. The proposed project would widen a segment of Latrobe Road between 4 and 5 feet such that it would accommodate future Class 2 bicycle lanes and transition into the future Class 1 along the Sacramento-Placerville Transportation Corridor.

This page is intentionally blank.

4.16 Utilities and Service Systems

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Would the project:				
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?				✓
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?				✓
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?			✓	
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?				✓
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?				✓
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?			✓	
g) Comply with federal, state, and local statutes and regulations related to solid waste?			✓	

4.16.1 Environmental Setting

Utilities located within and adjacent to the project area include electricity provided by Pacific Gas and Electric (PG&E) and telephone services provided by AT&T. Solid waste

services in the project area are provided by El Dorado Disposal Service, Inc. Storm drainage facilities are maintained by El Dorado County.

4.16.2 Potential Environmental Effects

- a) *Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?*

No Impact. The proposed project would not produce additional wastewater. Therefore, the proposed project would not result in impacts to wastewater treatment facilities.

- b) *Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?*

No Impact. Please refer to response a) above. Furthermore, the project would not require the use of water beyond that already available in the area for emergency purposes. The project would have no impact on water or wastewater treatment facilities.

- c) *Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?*

Less Than Significant. The project would result in the addition of 0.4 acre (17,424 square feet) of impervious surface in the form of realigned roadway surface. The stormwater runoff associated with the increase in impervious surface within the project area would be accommodated by existing and new drainage systems. This impact is considered less than significant.

- d) *Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?*

No Impact. The proposed project would require no water service. Therefore, the proposed project would have no impact on water supplies.

- e) *Result in a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project's projected demand, in addition to the provider's existing commitments?*

No Impact. The proposed project would not produce wastewater; therefore, the proposed project would not result in an impact to wastewater treatment capacity.

- f) *Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?*

Less than Significant. Solid waste generated by the project would be limited to construction debris, including asphalt generated by the excavation of existing roadway and construction of the proposed improvements. Solid waste disposal would occur in accordance with federal, state and local regulations. Disposal would occur at permitted landfills. Therefore, the proposed project would not generate the need for new solid waste facility and the project's impacts would be considered less than significant.

- g) *Comply with federal, state and local statutes and regulations related to solid waste?*

Less Than Significant. The proposed project would conform to all applicable state and federal solid waste regulations; therefore, the impact would be considered less than significant.

This page is intentionally blank.

4.17 Mandatory Findings of Significance

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?			✓	
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?			✓	
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?			✓	

a) *Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of rare or endangered plants or animals, or eliminate important examples of the major periods of California history or prehistory?*

Less Than Significant. As discussed throughout this checklist, the project is not expected to degrade the quality of the environment. Furthermore, the project is not expected to substantially reduce the habitat or affect populations of any fish or wildlife species (see Section 4.4) or eliminate important examples of the major period of California history or prehistory (see Section 4.5).

- b) *Does the project have impacts that are individually limited, but cumulatively considerable? "Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects?*

Less than Significant. The following sections discuss the potential for cumulative impacts associated with each resource checklist category in the preceding sections.

Aesthetics

The El Dorado County General Plan EIR (2003) discusses the cumulative effects on the visual resources along U.S 50; however, discussion of cumulative visual effects outside of the U.S. 50 corridor is not provided.

Implementation of the proposed project is not expected to contribute to cumulative visual resource impacts associated with the realignment of Latrobe Road within the project area. The proposed project would not significantly alter the existing visual character of the project area, would not result in the removal of an identified scenic resource, and is not visible from a State scenic highway. The proposed project does involve the removal of trees in the project area; however, the proposed project would retain an acceptable amount of tree canopy within the project area (see Section 4.4 of this MND). Thus, a less than significant impact to aesthetics is anticipated under cumulative conditions.

Agricultural Resources

No agricultural resources are present within the project area or in the areas immediately surrounding or adjacent to the roadway. Though some lands adjacent to the project area are zoned "Residential Agricultural", no Farmland is present within the project area, and the project would not result in conversion of Farmland to a non-agricultural use. Therefore, the proposed project would not impact agricultural resources under cumulative conditions.

Air Quality

The project would result in temporary (construction-related) increases in PM₁₀, NO_x, and ROG. However, project construction emissions were determined to be less than significant. This determination is based upon significance thresholds prescribed by the EDCAQMD and developed in recognition of the County's air quality (including its ozone and PM₁₀ non-attainment status). These criteria are therefore considered applicable for consideration of project-related cumulative impacts. As a result, it has been determined that the project would not result in cumulatively considerable long-term effects upon the region's air quality.

The El Dorado County General Plan EIR (2003) discusses the cumulative effects on air quality due to planned development which would result in increases in motor

vehicle travel, wood fire stoves/fireplaces, and other sources that could contribute cumulatively to the significant impact on air quality in the region. Because the proposed project would not result in increases in motor vehicle travel or associated air pollutant emissions, the proposed project would not impact air quality under cumulative conditions.

Biological Resources

The El Dorado County General Plan EIR (2003) discusses the cumulative effects on biological resources due to planned development which has the potential to reduce populations of special-status species, such as rare plant communities and the California red-legged frog, that occupy oak woodland, chaparral, and riparian habitats. The potential for special-status species to occur within the project area is low, therefore, this potential cumulative impact is less than significant. Implementation of Mitigation Measures 1 through 4 would ensure less than significant impacts to CRLF/FYLF, Swainson's hawk, birds protected by the MBTA, special-status species, and waters of the U.S., respectively. Since the project level impacts associated with biological resources would be reduced to less than significant, potential cumulative impacts to biological resources would be reduced to less than significant as well.

Cultural Resources

No cultural resources have been identified within the project site. Implementation of the proposed project would not impact any known historical, archaeological, paleontological, or cultural resources in the project area. If previously undiscovered cultural resources are discovered during construction activities, the proposed project would comply with the provisions of the California Health and Safety Code Section 7050.5 and California Public Resources Code Section 5097.94 et seq., regarding the discovery and disturbance of human remains should any human remains be discovered during project construction. The project level impacts to cultural resources associated with the proposed project would be mitigated to a less-than-significant level. Therefore, the project would not contribute to potential cumulative impacts associated with the destruction of undiscovered cultural resources.

Geology and Soils

The El Dorado County General Plan EIR (2003) discusses the cumulative effects on geology and soils due to planned development as site-specific. No cumulative effects were identified in the General Plan EIR. Project-related impacts on geology and soils would be site-specific and implementation of the proposed project would not contribute to seismic hazards or water quality impacts associated with soil erosion. Cumulative water quality impacts associated with soil erosion by the proposed project would be less than significant through compliance with regulatory requirements including: the El Dorado County Grading Ordinance, Storm Water Management Plan,

Statewide General Permit for Small Municipalities, and Statewide General Permit for Construction Discharges (all requiring revegetation of disturbed areas, and implementation of BMP's for erosion control in accordance with Resource Conservation District recommendations, including storm drain outlet protection, overside drains, rip rap, lined ditch and vegetation practices). Therefore, the proposed project is anticipated to have a less than significant impact on cumulative geophysical conditions in the region.

Hazards and Hazardous Materials

The El Dorado County General Plan EIR (2003) discusses the cumulative effects on human health and safety (which includes hazardous materials transportation safety, electromagnetic fields, naturally occurring asbestos, and wildland fire exposure) due to planned development as site-specific. The proposed project is not expected to result in any site-specific public health or hazard impacts. The project is expected to have no impact on cumulative hazard conditions.

Hydrology and Water Quality

The El Dorado County General Plan EIR (2003) discusses the cumulative effects on hydrology and water quality due to planned development. The proposed project would contribute to minimal increased storm drainage flows in the project area and would not negatively impact surface water quality. Adherence to the Statewide General Permit for Construction Discharges and the County's NPDES General Permit for Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems, would result in a less than significant impact to hydrology and water quality. The Proposed project would not violate any water quality standard and would not increase the risk of flooding in the project area. Therefore, the project would not contribute to cumulative surface or groundwater impacts.

Land Use and Planning

As described in this Initial Study, the Proposed project would provide safety improvements to Latrobe Road within the project area. No land use impacts were identified for this project; therefore, the proposed project would not contribute to cumulative impacts associated with land use that were identified in the 2003 El Dorado County General Plan EIR. The proposed project is anticipated to have no impact on cumulative land use conditions in the region.

Mineral Resources

The El Dorado County General Plan EIR (2003) discusses the cumulative effects on mineral resources due to planned development as site-specific. The proposed project is not expected to result in any site-specific significant impacts to mineral resources. Additionally, the project is expected to have no impact on mineral resources under cumulative conditions.

Noise

The El Dorado County General Plan EIR (2003) discusses the cumulative effects on noise levels outside of the regional freeway and U.S. 50 corridors due to planned development as site-specific. Construction contractors will be required to conduct construction activities in compliance with the El Dorado County General Plan Noise Element. Due to compliance with these policies, the Proposed project would have a less than significant cumulative impact to the project area.

Population and Housing

As described in this Initial Study, the proposed project consists of the realignment of Latrobe Road within the project area. No new construction of housing or removal of existing housing is proposed in association with the project. The proposed project is anticipated to have no impact on cumulative population and housing conditions in the region.

Public Services

The project would not result in a significant effect on public services and is not expected to contribute to cumulative public service impacts.

Recreation

The project would not directly or cumulatively affect the use of parks or other recreation facilities.

Transportation/Traffic

As described in Section 4.14 of the Initial Study, the proposed project would result in the realignment of Latrobe Road within the project area. The project is intended to improve the safety operations of the roadway segment within the project area. The project is therefore expected to have a beneficial impact on cumulative traffic operations in the project area.

Utilities and Service Systems

Construction activities related to the proposed project may result in temporary impacts to utilities and service systems, including–electric and telephone–facilities. The proposed project includes project commitments that require the County to coordinate with local utility providers early in the planning process to ensure that existing infrastructure in the project area is not damaged during construction activities, and that planned improvements to the underground utilities in the project area are coordinated with the roadway improvements. Additionally, adherence to the California Streets and Highways Code and the Public Utility Code would ensure that potential impacts are not cumulatively considerable.

- c) *Does the project have environmental effects that will cause substantial adverse effects on human beings, either directly or indirectly?*

Less than Significant. The project is intended to provide safety improvements to the roadway segment within the project area and would result in beneficial effects. The project would not result in substantial direct or indirect adverse effects from noise, either during project operation or construction, nor would it result in impacts to air quality, water quality, or utilities and public services. Therefore, the project would have a less than significant impact on human beings.

Mitigation Monitoring Plan

Mitigation Monitoring Plan
for the
Latrobe Road Realignment Project

CEQA Lead Agency:
El Dorado County

Prepared: February 2009

Adopted by Board of Supervisors on: _____

INTRODUCTION

Purpose

El Dorado County (County) has prepared a Mitigated Negative Declaration (MND) for the proposed Latrobe Road Realignment Project. The MND identified five mitigation measures that are required to avoid potentially significant impacts of the proposed project or to reduce impacts to less-than-significant levels. This Mitigation Monitoring Plan (MMP) identifies each of the mitigation measures that must be implemented in association with the project, if adopted by the Board of Supervisors, upon adoption of the MND. This document lists each individual impact for which mitigation measures were identified in the project MND, presents each corresponding mitigation measure, identifies the implementation process for each mitigation measure, identifies criteria to determine the effectiveness of mitigation implementation, defines the time frame for implementation, and provides signed verification of the party responsible for monitoring and reporting the implementation of each measure. This MMP will be used by the County to ensure implementation of the mitigation requirements of the project and to verify that all required mitigation measures are incorporated into the project.

El Dorado County, as the lead agency in CEQA compliance, will be responsible for overseeing implementation and administration of this MMP. The County will designate a staff member to manage the MMP. Duties of the staff member responsible for program coordination would include conducting routine inspections, reporting activities, coordinating with the project contractor, and ensuring enforcement measures are taken if necessary.

Regulation

California Public Resources Code Section 21081.6 requires public agencies to adopt mitigation or reporting plans when they approve projects requiring preparation of a MND that identifies significant environmental impacts. The reporting and monitoring plans must be adopted when a public agency makes its findings pursuant to the California Environmental Quality Act (CEQA) so that the mitigation requirements can be made conditions of project approval.

Format

The MMP outlines the impacts and mitigation measures described in the project MND. Each of the impacts discussed within this MMP are numbered based upon the sequence in which they are discussed in the MND.

A summary of each impact with the corresponding specific mitigation measure identified within the MND is provided. Each mitigation measure is followed by an implementation description, the criteria used to be used to determine the effectiveness of the mitigation, implementation timing and the party responsible for monitoring the implementation of

the measure. Although the implementation of certain measures may be the responsibility of County contractors, the ultimate monitoring and confirmation responsibility lies with County staff. Finally, each measure also contains a “Verified By” signature line which will be signed by the County project manager when the measure has been fully implemented and no further actions or monitoring is necessary for the implementation or effectiveness of the measure.

Impact 4.4(a): The proposed project has the potential to impact Foothill yellow-legged frog (and California red-legged frog) habitat.

Mitigation Measure 1: The County shall implement the following measures to minimize impacts on Foothill yellow-legged frogs (FYLF) and California red-legged frogs (CRLF):

- Wetted channel segments, areas of riparian scrub, and other Environmentally Sensitive Areas within the project study area, but outside the construction impact area, shall be staked and flagged to avoid encroachment by equipment and construction crews. Environmentally Sensitive Areas within the construction impact area that can be avoided by equipment and crews shall also be staked and flagged to minimize effects of construction.
- A FYLF/CRLF survey of the project site 48 hours before the onset of work activities. If any life stage of the FYLF/CRLF is found, and these individuals are likely to be killed or injured by work activities, the approved biologist shall be allowed sufficient time to move them from the site before work activities begin. The biologist shall relocate the FYLF/CRLFs the shortest distance possible to a location that contains suitable habitat and shall not be affected by activities associated with the proposed project.
- During project activities, all trash that may attract predators shall be properly contained, removed from the work site, and disposed of regularly. Following construction, all trash and construction debris shall be removed from work areas.
- All refueling, maintenance, and staging of equipment and vehicles shall occur at least 60 feet from channels or water bodies and not in a location from where a spill would drain directly toward aquatic habitat. The monitor shall ensure contamination of habitat does not occur during such operations. Prior to the onset of work, the County shall ensure that a plan is in place for prompt and effective response to any accidental spills. All workers shall be informed of the importance of preventing spills and of the appropriate measures to take should a spill occur.
- Portions of the project area that are temporarily impacted shall be revegetated with an assemblage of native vegetation suitable for the area. Locally collected plant materials shall be used to the extent practicable. Invasive, exotic plants shall be controlled to the maximum extent practicable. This measure shall be implemented in all areas disturbed by activities associated with the project, unless the County determines that it is not feasible or practical. (For example, an area disturbed by construction that would be used for future activities need not be revegetated.)

- The number of access routes, size of staging areas, and the total area of the activity shall be limited to the minimum necessary to achieve the project goal. Environmentally Sensitive Areas shall be established to confine access routes and construction areas to the minimum area necessary to complete construction, and minimize the impact to FYLF/CRLF habitat; this goal includes locating access routes and construction areas outside of wetlands and riparian areas to the maximum extent practicable.
- The County shall attempt to schedule work activities for times of the year when impacts to the FYLF/CRLF would be minimal. To control sedimentation during and after project implementation, the County and its contractors shall implement BMPs outlined in any authorizations or permits, issued under the authorities of the Clean Water Act that it receives for the specific project. If best management practices are ineffective, the County shall attempt to remedy the situation immediately.
- The monitoring biologist shall permanently remove any individuals of exotic species, such as bullfrogs, crayfish, and centrarchid fishes from the project area, to the maximum extent possible. The biologist shall be responsible for ensuring his or her activities are in compliance with the California Fish and Game Code.
- To ensure that diseases are not conveyed between work sites by the biologist, the fieldwork code of practice developed by the Declining Amphibian Populations Task Force shall be followed at all times.

Implementation: The County will retain the services of a qualified biologist to conduct pre-construction FYLF/CRLF surveys and will implement the measures as described above.

Effectiveness Criteria: The County will prepare and keep on file documentation verifying the implementation of the above referenced measures.

Timing: Pre-Construction and Construction Phases

Verified By: _____ **Date:** _____
 County Project Manager

Impact 4.4(a): The proposed project has the potential to impact Swainson's hawk nesting habitat.

Mitigation Measure 2: Pre-construction raptor nesting surveys shall be conducted prior to development of the site (if construction activities are initiated between March 1 and September 15) to determine if any Swainson's hawk nest trees occur within 0.8 km (0.5 mi) of the site. Based on the survey protocol developed by the Swainson's Hawk Technical Advisory Committee, at least two survey periods prior to the project's initiation are required, which must be conducted between sunrise and 12:00 p.m. and between 4:00 p.m. and sunset (CDFG, 2000). If active Swainson's hawk nests are identified within 0.8 km (0.5 mi) of the project area, mitigation shall include:

- Postpone project activities until after the young have fledged and are no longer dependent on the nest tree; or
- If it is not possible to postpone project activities that may cause nest abandonment within 0.8 km (0.5 mi) of the nest site, with the approval of CDFG, conduct intensive monitoring of the nest site. Monitoring shall be conducted by a CDFG-approved raptor biologist during construction. The biologist shall have authority to stop all construction activities if adverse effects to adults and nestlings are occurring.

Implementation: This measure shall be implemented in the manner described above. The County, using the services of a qualified biologist, will conduct pre-construction surveys if construction activities are initiated between March 1 and September 15.

Effectiveness Criteria: The County shall prepare and keep on file documentation verifying the results of the pre-construction surveys.

Timing: Pre-Construction Phase

County Project Manager

Impact 4.4(a): Tree removal and/or ground clearing activities associated with the proposed project could impact listed bird species and bird species protected under the MBTA.

Mitigation Measure 3: The following measures shall be implemented to reduce project impacts on bird species:

- Minimize removal of native vegetation by locating staging areas and access routes in previously disturbed areas;
- Removal of vegetation shall be conducted in the fall and winter (between September 15 and March 1) after fledging and before the initiation of breeding activities;
- Pre-construction bird surveys shall be performed in spring to determine the location of nest sites within the project area. A 30 m (100 ft) buffer zone shall be established between active passerine nests and the project area, and a 150 m (500 ft) buffer zone between active raptor nests and the project area, unless CDFG permits a reduced buffer zone based on nesting phenology and recommendation(s) of a biological monitor;
- Construction activities shall be confined to the BSA to minimize the effects on wildlife occurring adjacent to the project area. Construction equipment shall be required to have functional mufflers and properly tuned and maintained in a manner to reduce noise levels.

Implementation: The County will retain the services of a qualified biologist to conduct pre-construction surveys for nesting listed bird species and/or bird species protected under the MBTA and will implement the measures as described above.

Effectiveness Criteria: The County will prepare and keep on file documentation verifying the methods used by, conditions observed by, and conclusions/recommendations of the qualified biologist conducting the pre-construction surveys for nesting listed bird species and/or bird species protected under the MBTA. The County will also prepare and keep on file documentation verifying the implementation of the above referenced measures.

County Project Manager

Impact 4.4(c): **The proposed project has the potential to impact wetlands or water of the U.S. protected for Section 404 of the Clean Water Act.**

Mitigation Measure 4: If the final project designs are able to avoid wetlands impacts resulting in project-related impacts to jurisdictional waters of the U.S. totaling less than 0.1 acre, a post-construction notification letter shall be required for impacts to these features. The requirements of a post-construction notification letter are summarized below:

Army Corps of Engineers Post-Construction Notification

The project developer shall prepare a letter to notify the Corps of discharges causing the loss of 0.1 acre or less of waters of the U.S., resulting from the project (after project completion). This report shall be submitted within 30 days of completion of the work, to the District Engineer and shall contain the following information: (1) The name address and telephone number of the permittee; (2) the location of the work; (3) the type and acreage of the loss of waters of the U.S.; and (4) the type and acreage of any compensatory mitigation used to offset the loss of waters of the U.S.

Implementation: In the event that final project designs result in project-related impacts to jurisdictional waters of the U.S. totaling less than 0.1 acre, the County shall submit a post-construction notification letter to the U.S. Army Corps of Engineers. If project-related impacts exceed 0.1 acre, then the County will submit a Section 404 permit application to the U.S. Army Corps of Engineers.

Effectiveness Criteria: The County will prepare and keep on file documentation verifying the submittal of the post-construction notification letter.

Timing: Post-Construction Phase

Verified By: _____ **Date:** _____
County Project Manager

Impact 4.5(a and b): Construction activities could potentially disturb unknown cultural resources.

Mitigation Measure 5: Any and all potential archaeological resources discovered during construction shall be examined by a qualified archaeologist, who shall examine the findings, assess their significance, and offer recommendations for appropriate handling procedures. Work within 100 feet of the find shall cease.

In the event that unanticipated cultural or paleontological resources (including structural features, unusual amounts of bone or shell, artifacts, human remains, or architectural remains) are encountered during construction, all earthmoving activity shall cease until the developer retains the services of a qualified archaeologist. The archaeologist or paleontologist shall examine the findings, assess their significance, and offer recommendations for procedures deemed appropriate to either further investigate or mitigate adverse impacts to those cultural or paleontological archaeological resources that have been encountered (e.g., excavate the significant resource).

Implementation: In the event that construction contractors retained by the County unearth potential archaeological resources as identified in the mitigation language above, the County will retain the services of a qualified archaeologist to examine the findings, assess their significance, and offer recommendations for appropriate handling procedures.

In the event that human bone or bones of unknown origin are discovered during project construction, the El Dorado County Coroner will be immediately notified. If it is discovered that the remains are Native American, the County will develop a program for re-interment in coordination with the most likely descendant.

Effectiveness Criteria: The County will prepare and keep on file documentation verifying the methods used by, conditions observed by, and conclusions/recommendations of the qualified archaeologist retained by the County in the event construction activities unearth cultural resources.

Timing: Throughout Construction Phase
